BUFFERED EXPLOSIONS IN STEEL PRESSURE VESSELS
L. A. Glenn 1986 12 p Presented at the 9th International Conference on High Energy Rate Fabrication, Novosibirsk, USSR, 18 Aug. 1986
(Contract W-7405-eng-48)
(DE86-008763; UCRL-94255; CONF-860844-1) Avail: NTIS HC A02/MF A01

The impulse delivered to the walls of a vessel containing an explosion will increase if material is placed between the walls and the charge. If the impulse application time is small in comparison with the eigenperiod of the vessel, the wall stress will increase in direct proportion to the impulse. Conversely, if the application period can be extended beyond half the eigenperiod, the peak stress will be proportional to the ratio of the impulse to the delivery period. With powder or granular buffers, it is possible for the delivery period to increase faster than the impulse as the buffer mass is increased. This is the reason why certain powders, or porous materials, can provide stress reduction even below that observed by evacuating the space between the walls and the explosive. If the buffer material is to serve as an effective mitigator, it must collapse on shock loading to a final density that depends only weakly on pressure; the criterion is that the wave speed in the material that impacts the wall must be small compared with the impact (particle) speed. This behavior apparently occurs with salt, at least for modest values of the charge parameter, but to a lesser extent with snow under the same conditions. The vermiculite data are comparable to the salt in the charge parameter region where the two overlap; with increasing explosive, however, the vermiculite appears to behave like the snow and its effectiveness as a mitigator rapidly diminishes. It is also clear that once the wave speed criterion is seriously violated, the use of a powder buffer will result in a higher wall stress than if only air filled the space between walls and charge. DOE

SHOWER AND HIGH-PRESSURE OIL TEMPERATURE CONTROL
D. B. DeBra (Stanford Univ., Calif.), R. A. Victor, and J. B. Bryan Mar. 1986 20 p Presented at the 36th International Institution for Production Engineering Research General Assembly, Jerusalem, Israel, 16 Aug. 1986 Prepared in cooperation with Lawrence Livermore National Lab., Calif.
(Contract W-7405-eng-48)
(DE86-009398; UCRL-94273; CONF-860839-2) Avail: NTIS HC A02/MF A01

Oil showering for temperature control of precision tools is an effective way of achieving close temperature stability and isolation from variations in room air temperature. The oil must be controlled to temperature variations less than tolerances specified for machine and parts. Principal disturbances come from heat transfer into the plumbing between the heat exchanger and the tool and from variations in the chill water in the heat exchanger. We describe the successful employment of measuring techniques, isolation from disturbances, and the use of integral control with proportional and commercially available temperature controllers. Commercially available heat exchangers are low-pressure devices. For high-pressure oil applications a pump follows the heat exchanger, and, because of the high velocities and large surface area, the oil passing the pump is sensitive to heat from its motor and from room air. Combinations of feedback from different locations in the system are discussed. Compromises with regard to measuring at the functional point versus minimizing time delay, and the importance of measuring near the site of disturbing heat sources lead to multiple sensors in some cases. Each measurement may be used through integral feedback to provide the best performance. The introduction of integral control to commercial a-c bridge controllers can be awkward. Six approaches are compared, and the millidegree performance of our current designs is presented. DOE

LOCALIZED ION MILLING OF METALLIC AND CERAMIC TEM SPECIMENS
A. T. Fisher and J. Bentley 1986 3 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009538; CONF-860829-23) Avail: NTIS HC A02/MF A01

The utility of localized ion milling in the preparation of metallic and ceramic specimens for TEM and AEM is being evaluated from the standpoint of optimizing procedures and identifying limitations and milling characteristics. The equipment used was a Gatan model 645 precision ion milling system (PIMS). This device is a scanning ion beam instrument with which selected areas of a sample can be imaged by either secondary electron or secondary ion signals and selectively ion milled in a small region within the imaged area. The 1 to 10 keV ion beam can be focussed to a 2 micron spot. Specimens are thinned without removing them from the electron microscope specimen holder. DOE

MECHANICAL INTERACTIONS OF ROUGH SURFACES Quarterly Progress Report, Apr. 1 - 30 Jun. 1986
J. I. McCool Jun. 1986 7 p
(Contract DE-AC02-84ER-13163)
(DE86-010886; DOE/ER-13163/11) Avail: NTIS HC A02/MF A01

Simulation studies have been performed to yield the complete distribution of asperity contact area, load and pressure as a function of the separation of rough surfaces. Microcontact models ordinarily yield just the average value of these quantities with no measure of the scatter about the average. The low sliding speed microcontact flash temperature distribution is shown to be computable as a by product of the determination of the microcontact area distribution. A Coulomb friction model for traction in the mixed film regime is tested against published data. The required Coulomb friction coefficient is found to be unreasonably large. A suggested explanation is that only contacts larger than some critical minimum can cause loss of electrical insulation between sliding disks. Preliminary ceramic microfracture experiments have resulted in plastic deformation rather than fracture at asperity tips. DOE

LIQUID METAL THERMOACOUSTIC ENGINE
G. W. Swift, A. Migliori, and J. C. Wheatley 1986 7 p Presented

at the Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25 Aug., 1986
(Contract W-7405-eng-36)
(DE86-011264; LA-UR-86-1548; CONF-860810-6) Avail: NTIS HC A02/MF A01

We are studying a liquid metal thermoacoustic engine both theoretically and experimentally. This type of engine promises to produce large quantities of electrical energy from heat at modest efficiency with no moving parts. A sound wave is usually thought of as consisting of pressure oscillations, but always attendant to the pressure oscillation are temperature oscillations. The combination produces a rich variety of thermoacoustic effects. These effects are usually so small that they are never noticed in everyday life; nevertheless under the right circumstances they can be harnessed to produce powerful heat engines, heat pumps, and refrigerators. In our liquid metal thermoacoustic engine, heat flow from a high temperature source to a low temperature sink generates a high-amplitude standing acoustic wave in liquid sodium. This acoustic power is converted to electric power by a simple magnetohydrodynamic effect at the acoustic oscillation frequency. We have developed a detailed thermoacoustic theory applicable to this engine, and find that a reasonably designed liquid sodium engine operating between 700 C and 100 C should generate about 60 W/cm(2) of acoustic power at about 1/3 of Carnot's efficiency. Construction of a 3000 W-thermal laboratory model engine has just been completed, and we have exciting preliminary experimental results as of the time of preparation of this manuscript showing, basically, that the engine works. We have also designed and built a 1 kHz liquid sodium magnetohydrodynamic generator and have extensive measurements on it. It is now very well characterized both experimentally and theoretically. The first generator of its kind, it already converts acoustic power to electric power with 40% efficiency. DOE

LINEAR HARMONIC ANALYSIS OF FREE-PISTON STIRLING ENGINES
N. C. J. Chen and F. P. Griffin Jun. 1986 104 p
(Contract DE-AC05-84OR-21400)
(DE86-012451; ORNL/CON-172) Avail: NTIS HC A06/MF A01

The equations that govern the behavior of free-piston Stirling engines are nonlinear differential equations. Traditional solution methods have been time-stepping integrations that can be plagued by numerical instabilities and can use large amounts of computer time. Closed-form analytical solutions are possible if the working gas behaves isothermally or if the nonlinear terms in the governing equations are replaced with accurate approximations. An almost closed-form solution method, called the linear harmonic analysis (LHA), has been developed for free-piston Stirling engine applications by representing all of the periodic variables with harmonic functions. The solution method accounts for the important thermodynamic losses that are coupled together in free-piston engines, yet it is efficient enough for optimization studies. The LHA method was compared with a standard numerical integration method to verify its mathematical accuracy. The LHA and numerical predictions for a sample free-piston Stirling engine configuration differed by less than 5% for all important parameters. Sensitivity studies using the LHA method have also shown that the thermodynamic loss assumptions used in an analysis can have a significant impact on the predicted dynamic behavior of a free-piston Stirling engine. DOE

EFFECTS OF INERTIA WELD PARAMETERS AND CONTAMINATION ON WELD FLASH SHAPE AND ON JOINT STRENGTH: AN IMPROVED STUDY
M. W. Mote Jun. 1986 41 p
(Contract DE-AC04-76DP-00789)
(DE86-013074; SAND-85-8239) Avail: NTIS HC A03/MF A01

Inertia welds of four dissimilar metal pairs in three configurations were made with extensive variations in energy and force to discover limits for the weld process and assure that process monitoring of welds provides quality assessment. In a related study of the effect of surface contamination, using one set of welding parameters, we showed that in two cases wherein only one of the metals in the pair deforms, contamination can preclude welding without altering weld configuration or upset. However, contamination had no effect on all-steel welds. DOE

SENSOR CONTROLLED ROBOTIC WELDING FOR NUCLEAR APPLICATIONS Annual Progress Report
B. A. Chin, N. H. Madsen, and J. S. Goodling 30 May 1986 18 p
(Contract DE-FG05-85NE-37949)
(DE86-013110; DOE/NE-37949/1) Avail: NTIS HC A02/MF A01

Significant accomplishments towards the development of an adaptive robotic welding system have been made during the first eight months of the project. The project is currently within budget and on schedule. Accomplishments were both scientific and programmatic in form. A list of the scientific accomplishments follows: demonstrated that the thermal profiles generated for intentionally induced defects during the welding process are similar in steel, aluminum and stainless steel. The conclusion is therefore that infrared sensing is applicable to the welding of over 90% of all materials used in the energy industry. Completed design and testing of a first generation communication system used to transfer information from the infrared camera to the computer in a near real time form. This demonstrates that information can be obtained, sorted, transferred and received in a time frame consistent with on-line process control. Demonstrated rudimentary seam tracking using infrared sensing and closed loop logic routines. A linear relationship exists between measured peak surface temperature and depth of penetration. Similarily, a linear relationship exists between measured infrared width and weld bead width. These relations suggest that penetration parameters may be controlled using surface measurements as obtained by infrared thermography. DOE

RESISTANCE SEAM WELDING
R. G. Thatcher Jul. 1986 16 p
(Contract DE-AC04-76DP-00613)
(DE86-013288; BDX-613-3557) Avail: NTIS HC A02/MF A01

Work was conducted to develop the capability to produce miniature resistance seam welds at the Bendix Kansas City Division (BKC) of Allied Corporation. This effort was initiated to weld aluminum foil to polyimide-backed copper foil on a flat cable. A parallel gap resistance welding head capable of accessing material from one side only was designed and fabricated for this purpose. Welds were made between aluminum and copper foils using the parallel gap resistance seam welding head. Bonds were made proving the welding head design was feasible. Aluminum to copper weld joints were analyzed by cross sectioning, electron beam microprobe analysis, and environmental testing. As expected with this material combination, testing indicated the presence of brittle, crack sensitive intermetallics in the weld zone. Work was expanded to develop a general resistance seam welding process capable of welding metal foils where there was access to both sides of the material. An opposed electrode welding head was designed and fabricated for this purpose. DOE

NDE RELIABILITY AND PROCESS CONTROL FOR STRUCTURAL CERAMICS
George Y. Baaklini 1986 17 p Proposed for presentation at the 32nd International Gas Turbine Conference and Exhibition, Anaheim, Calif., 31 May - 4 Jun. 1987; sponsored by ASME
(NASA-TM-88870; E-3276; NAS 1.15:88870) Avail: NTIS HC A02/MF A01 CSCL 14D

The reliability of microfocus x-radiography and scanning laser acoustic microscopy for detecting microvoids in silicon nitride and silicon carbide was statistically evaluated. Materials- and process-related parameters that influenced the statistical findings in research samples are discussed. The use of conventional x-radiography in controlling and optimizing the processing and sintering of an Si3N4-Si02-Y203 composition designated NASA 6Y is described. Radiographic evaluation and guidance helped develop uniform high-density Si3N4 modulus-of-rupture bars with improved four-point flexural strength (657, 544, and 462 MPa at room temperature, 1200 C, and 1370 C, respectively) and reduced strength scatter. RELIABILITY PREDICTION MODELS FOR MECHANICAL EQUIPMENT Interim Report, Oct. 1985 - Oct. 1986
James D. Raze Oct. 1985 66 p
(AD-A169775; Rept-2425) Avail: NTIS HC A04/MF A01 CSCL 13/9

The purpose of this report is to present a proposed methodology for predicting the reliability of mechanical equipment and solicit comments as to the potential utility of a complete handbook of reliability prediction procedures. The prediction methodology being developed considers the critical failure modes of a mechanical component, its material strengths, and the operating stresses at the component level. This method of analysis permits a prediction of the failure rate for each component of a mechanical system based upon the operating environment. GRA

As America strives to compete in the international marketplace, many U.S. businesses have adopted a new way of managing and measuring quality and productivity. The quality management methods focus on the systematic measurement and control of work processes. Successful quality management programs are credited with increases in profit, reduction of waste, and improved management-worker relations. This annotated bibliography is oriented toward those persons who are new to or only recently acquainted with the concept of quality management. The main body of journal articles, books, videotapes, and magazines selected from academia and industry focus on the introduction of the concepts, the terminology, and the personalities associated with the quality management movement. Citations include information about the author, date, title, and source, as well as a set of terms that summarize the key concepts of the citation and a brief abstract. Several articles are identified and recommended as an orientation to the field of total quality management. GRA

A NEW AND EFFICIENT FORMULATION FOR FINITE ELEMENT ANALYSIS OF THIN SHELL STRUCTURES UNDERGOING SMALL AND LARGE DEFLECTION Ph.D. Thesis
Jeong-Joo Rhiu 1985 238 p
Avail: Univ. Microfilms Order No. DA8608851

New finite element formulations are developed based on the Hellinger-Reissner principle with independent strain. By dividing assumed strain fields into the lower order part and the higher order part, the new formulations can be made much more efficient than the standard mixed formulations. Moreover, the present approach provides a rational way of introducing stabilization matrix to suppress undesirable spurious kinematic modes in finite element formulations. A nine node degenerate solid shell element based on the new formulation has been developed and tested for linear thin plate and shell problems. The numerical results indicate that this element is free of locking and successful in suppressing undesirable spurious kinematic modes. This nine node element is also extended to the analysis of thin shells undergoing large deflection in conjunction with the total Lagrangian scheme. A proper choice of integration strategy leads to a much simplified and less expensive formulation for geometrically nonlinear thin shells. Dissert. Abstr.

GUIDE TO THE USE OF DATA ITEMS ON THE FATIGUE STRENGTH OF WELDED JOINTS IN STEELS
Jul. 1986 23 p
(ESDU-86013; ISBN-0-85679-565-8; ISSN-0141-4089; ISSN-0144-2805) Avail: ESDU

Available as part of the ESDU Sub-series on Stress and Strength and on Engineering Structures, this ESDU discusses

actors that affect the fatigue strength of a welded joint and, in articular, from fracture mechanics arguments shows that the trength is independent of the strength properties of the parent aterial. Similar arguments show the likely effect of size is to oduce the fatigue strength over that found in smaller joints (such s laboratory specimens on which many of the fatigue data vailable depend). The influence of residual stresses, and in turn eir effect on the way mean stress is experienced, is discussed, nd the use of thermal stress relieving is considered. Various esign options for joints are indicated, together with likely crack itiation sites in each case. A complete directory of some 0 possible types of welded joints for which fatigue data are cluded in other ESDU documents (75016, 76007, 76032, 77011, 8016, 78023 and 81007) are listed together with their equivalent pe and class of weld as defined in BS 5400. NALYSIS OF MIXED-MODE CRACK PROPAGATION USING HE BOUNDARY INTEGRAL METHOD Final Report
exander Mendelson and Louis J. Ghosn Sep. 1986 194 p
irant NAG3-396)
IASA-CR-179518; NAS 1.26:179518) Avail: NTIS C A09/MF A01 CSCL 20K

Crack propagation in a rotating inner raceway of a high speed lier bearing is analyzed using the boundary integral equation ethod. The method consists of an edge crack in a plate under nsion, upon which varying Hertzian stress fields are superimsed. A computer program for the boundary integral equation ethod was written using quadratic elements to determine the ess and displacement fields for discrete roller positions. Mode I d Mode II stress intensity factors and crack extension forces G b 00 (energy release rate due to tensile opening mode) and G b r0 (energy release rate due to shear displacement mode) re computed. These calculations permit determination of that ck growth angle for which the change in the crack extension ces is maximum. The crack driving force was found to be the ernating mixed-mode loading that occurs with each passage of most heavily loaded roller. The crack is predicted to propagate a step-like fashion alternating between radial and inclined gments, and this pattern was observed experimentally. The ximum changes DeltaG sub 00 and DeltaG sub r0 of the crack ension forces are found to be good measures of the crack pagation rate and direction. Author

NAMIC ANALYSIS OF ANISOTROPIC CONICAL SHELLS
uni A. Lakis and Hamid Ouriche Oct. 1986 128 p
M/RT-86-36) Avail: NTIS HC A07/MF A01

An analysis is presented of the static and dynamic equilibrium thin anisotropic and non-uniform conical shells, subjected to arent boundary conditions. The procedure used was a hybrid based on Sander's shell theory and on the finite element hod as applied to thin shells having variable thickness and otropic elastic properties, but limited to cases of linear elasticity. displacement functions were derived from Sander's equations. stiffness and mass matrices were derived by exact analysis gration. The free vibration problem of conical shells was iced to an eigenvalues and eigenvectors problem. The vergence of the method proved to be satisfactory and the uencies and displacements were compared with existing lts. Author

-LINEAR ANALYSIS OF CYLINDRICAL SHELLS
i A. Lakis and Alberto Toledano Sep. 1986 103 p
/RT-86-37) Avail: NTIS HC A06/MF A01

theory to predict the influence of geometric nonlinearities e natural frequencies of an empty anisotropic cylindrical shell presented. It was a hybrid of finite element and classical thin theories. Sanders-Koiter's nonlinear and strain-displacement relations were used. Displacement functions were evaluated using linearized equations of motion. Modal coefficients were then obtained for these displacement functions. Expressions for the mass, linear and nonlinear stiffness matrices were derived through the finite element method. The uncoupled equations were solved with the help of elliptic functions. The period and frequency variations were first determined as a function of shell amplitudes and then compared with the results in the literature. Author

ANALYSIS OF ANISOTROPIC THIN CONICAL SHELLS
Aouni A. Lakis and Patrick Boisnaud 1986 146 p
(EPM/RT-86-38) Avail: NTIS HC A07/MF A01

A theory is presented for the static and dynamic analysis of thin conical anisotropic shells with bending resistance subject to an arbitrary distribution of loads. Sander's basic equilibrium equations were reduced to three differential equations of motion. Displacement, deformation, and stress relative to arbitrary boundary loadings and arbitrary distributed load were determined as a function of the shell characteristics. All boundary condition cases were derived in terms of eight constants. This theory was developed for thin shells where thickness is a function of the longitudinal direction generator to give homogeneous equations of motion. The numerical analysis is devoted to solving the characteristic equations for isotropic shells. The results are presented in the form of tables and graphs. The graphs are given in terms of the thickness-to-length ratio. Author

DYNAMIC ANALYSIS OF A TIMOSHENKO BEAM USING A FINITE ELEMENT APPROACH
Aouni A. Lakis and N. D. Trinh 1986 179 p
(EPM/RT-86-34) Avail: NTIS HC A09/MF A01

The finite element method was used in this investigation in order to determine the static and dynamic behavior of non-uniform Timoshenko beams subjected to various boundary conditions. When using this approach, the general displacement functions are based on the cubic polynomial expansion of the three principal quantities as degrees of freedom: transverse displacement, rotation of the cross section and shear deformation. The stiffness and mass matrices, however, are derived from expressions of the strain and kinetic energy which are based on the assumptions of curved, slightly curved and straight beams. In addition, a formula was obtained from the general equation for a slightly curved beam and as a result, frequency equations for a straight beam were obtained for ten common types, taking into account all the forced and natural boundary conditions. Good agreement was achieved by comparing the results of these models with exact solutions, as well as with other numerical methods for straight and tapered beams. In order to test the rate of convergence, the natural frequencies of typical cases were calculated as a function of the number of elements. Results showed that the model converged rapidly and required only a small number of elements to achieve good results. Finally, the present analysis demonstrated the reliability of the model chosen by including the transverse shear and rotary inertia effects at the higher modes. Author

FREE VIBRATION OF AXISYMMETRIC AND BEAM-LIKE CYLINDRICAL SHELLS, PARTIALLY FILLED WITH LIQUID
Aouni A. Lakis and Marwan Sinno 1986 142 p
(EPM/RT-86-35) Avail: NTIS HC A07/MF A01

A theory is presented for the determination of free vibration characteristics of anisotropic thin cylindrical shells, partially or completely filled with liquid for two circumferential wave numbers, n = 0 breathing and n = 1 beam-like. The method used was a hybrid one, based on the finite element method and supported by classical shell theories. The shell was subdivided into cylindrical finite elements and the displacement functions were obtained using

the shell's equations. Expressions for the mass and stiffness matrices for a finite element and for the whole structure were obtained. Similarly, a finite element was developed for the liquid in cases of potential flow. The natural frequencies of the shell in vacuo and partially filled were obtained and compared with existing experiments and other theories. Author

EFFECTS OF VARIABLES UPON PYROTECHNICALLY INDUCED SHOCK RESPONSE SPECTRA
James Lee Smith May 1986 61 p
(NASA-TP-2603; NAS 1.60:2603) Avail: NTIS HC A04/MF A01 CSCL 20K

Throughout the aerospace industry, large variations of 50 percent (6 dB) or more are continually noted for linear shaped charge (LSC) generated shock response spectra (SRS) from flight data (from the exact same location on different flights) and from plate tests (side by side measurements on the same test). A research program was developed to investigate causes of these large SRS variations. A series of ball drop calibration tests to verify calibration of accelerometers and a series of plate tests to investigate charge and assembly variables were performed. The resulting data were analyzed to determine if and to what degree manufacturing and assembly variables, distance from the shock source, data acquisition instrumentation, and shock energy propagation affect the SRS. LSC variables consisted of coreload, standoff, and apex angle. The assembly variable was the torque on the LSC holder. Other variables were distance from source of accelerometers, accelerometer mounting methods, and joint effects. Results indicated that LSC variables did not affect SRS as long as the plate was severed. Accelerometers mounted on mounting blocks showed significantly lower levels above 5000 Hz. Lap joints did not affect SRS levels. The test plate was mounted in an almost free-free state; therefore, distance from the source did not affect the SRS. Several varieties and brands of accelerometers were used, and all but one demonstrated very large variations in SRS. Author

FACTORS INFLUENCING ELASTIC STRESSES IN DOUBLE CANTILEVER BEAM SPECIMENS
J. H. Crews, Jr., K. N. Shivakumar (Analytical Services and Materials, Inc., Hampton, Va.), and I. S. Raju Nov. 1986 34 p
(NASA-TM-89033; NAS 1.15:89033) Avail: NTIS HC A03/MF A01 CSCL 20K

An elastic stress analysis was conducted for a double cantilever beam (DCB) specimen using finite-element methods. The purpose of this study was to identify the important parameters that influence stresses ahead of the delamination front. The study focused on an aluminum DCB specimen, typical of adhesively-bonded joints, and on a graphite/epoxy specimen representing a cocured composite. Opening mode sigma sub y stresses ahead of the crack tip were calculated and compared with those for a monolithic reference specimen. Beyond the singularity-dominated region very near the crack tip, the sigma sub y distribution was elevated compared to the monolithic case. Both the adhesive thickness and the adherend transverse (thickness-direction) stiffness were found to influence the elevation of sigma sub y. In contrast, adherend thickness and longitudinal stiffness has very little effect on this stress distribution. Estimates for adhesive yielding beyond the aluminum DCB crack tip showed that both the area and height of the plastic zone increased to a peak value for increasing adhesive thicknesses. Results from this study would provide insight for comparing data from different DCB specimens and for designing new DCB specimens. Author

(Contract NAS3-23697)
(NASA-CR-175060; NAS 1.26:175060; ASR-2; PWA-5940-36) Avail: NTIS HC A10/MF A01 CSCL 29K

A 3-D Inelastic Analysis Method program is described. This program consists of a series of new computer codes embodying a progression of mathematical models (mechanics of materials, special finite element, boundary element) for streamlined analysis of: (1) combustor liners, (2) turbine blades, and (3) turbine vanes. These models address the effects of high temperatures and thermal/mechanical loadings on the local (stress/strain)and global (dynamics, buckling) structural behavior of the three selected components. Three computer codes, referred to as MOMM (Mechanics of Materials Model), MHOST (Marc-Hot Section Technology), and BEST (Boundary Element Stress Technology), have been developed and are briefly described in this report. A CONSTITUTIVE LAW FOR FINITE ELEMENT CONTACT PROBLEMS WITH UNCLASSICAL FRICTION
Michael E. Plesha and Bruce M. Steinetz Nov. 1986 19 p
(NASA-TM-88838; E-3181; NAS 1.15:88838; ICOMP-86-1) Avail: NTIS HC A02/MF A01 CSCL 20K

Techniques for modeling complex, unclassical contact-friction problems arising in solid and structural mechanics are discussed. A constitutive modeling concept is employed whereby analytic relations between increments of contact surface stress (i.e., traction) and contact surface deformation (i.e., relative displacement) are developed. Because of the incremental form of these relations, they are valid for arbitrary load-deformation histories. The motivation for the development of such a constitutive law is that more realistic friction idealizations can be implemented in finite element analysis software in a consistent, straightforward manner. Of particular interest is modeling of two-body (i.e., unlubricated) metal-metal, ceramic-ceramic, and metal-ceramic contact. Interfaces involving ceramics are of engineering importance and are being considered for advanced turbine engines in which higher temperature materials offer potential for higher engine fuel efficiency. A STUDY OF THE MECHANISM OF DYNAMIC DUCTILE FRACTURE OF TWO-PHASE MATERIALS Final Report, 1982 - 1985
Minoru Taya, Ian W. Hall, and H. S. Yoon 30 May 1986 35 p
(Contract DAAG29-82-K-0144)
(AD-A168966; ARO-18325.7-EG) Avail: NTIS HC A03/MF A01 CSCL 20/11

Dynamic ductile fracture of two phase material have been investigated in two stages. The first stage is a model study where an idealized two phase material, single crystal Cu-SiO2 was used to study the initiation and growth of voids, the dislocation morphology and the other microscopic behavior that took place in the as-impacted specimen. Important findings are voids were nucleated from only a fraction of secondary particles SiO2, the larger strain has induced the higher void density, and the dislocation cell structures were formed with the average cell size being constant for the range of strain rates investigated. Analytical models were constructed with the aim of simulating the void growth in a two phase material subjected to high strain rate deformation, static void growth model and dynamic void growth model. A comparison of the void density indicated the static void growth model can predict the experimental results reasonably well for the smaller strain, but it fails to predict for the larger strain, while the dynamic void growth model can simulate the void growth well for the entire range of strain and strain rates. The second stage conducts a series of experiments on more realistic two phase materials, Al-Si alloy and SiC(w) or SiC(p)/Al composite. The mode of the initiation and growth of voids was observed in the specimens that were impacted by Split Hopkinson bar test. The void density was also measured along the specimen axis and its values were compared

with the analytical results by the static void growth model, resulting in a reasonably good agreement. GRA

AN ANALYSIS OF SHEAR BAND DEVELOPMENT INCORPORATING HEAT CONDUCTION
J. LeMonds and A. Needleman May 1986 37 p
(Contract DAAG29-85-K-0003)
(AD-A168972; ARO-22306.5-EG) Avail: NTIS HC A03/MF A01 CSCL 20/13

We incorporate the effects of material temperature sensitivity and heat conduction into an infinite band type analysis of shear localization. Full account is taken of finite geometry changes, but inertial effects are neglected. An energy balance is written between homogeneously deforming bands in a manner that models conditions in our recent finite element study of shear band development from internal inhomogeneities in a solid subject to plane strain compression. The band analysis requires specification of an imperfection amplitude and a length scale over which heat conduction effects are significant. These are chosen to match results of a finite element analysis. The predictions of the simple band analysis and the results of full finite element calculations are then compared for a wide range of material properties for both isotropic and kinematic hardening characterizations of the flow potential surface. The predicted dependence of the onset of localization on material properties such as strain hardening and strain rate sensitivity is the same for both types of analysis. GRA

FINITE ELEMENT ANALYSES OF SHEAR LOCALIZATION IN RATE AND TEMPERATURE DEPENDENT SOLIDS
J. LeMonds and A. Needleman May 1986 59 p
(Contract DAAG29-85-K-0003)
(AD-A169057; ARO-22306.6-EG) Avail: NTIS HC A04/MF A01 CSCL 20/11

The effects of strain hardening, strain rate sensitivity, thermal softening, heat conduction and the imposed strain rate on the shear localizaton process in plane strain compression are examined. Deformation, stress and temperature fields are computed in an infinite solid which contains a periodic rectangular array of inhomogeneities. The inhomogeneities give rise to non-uniform deformation fields which, under certain conditions, may localize in the form of a shear band. Boundary conditions are prescribed such that the resulting fields possess periodicity with respect to the inhomogeneity distribution. In this manner, attention may be confined to a rectangular region of the solid which surrounds a single inhomogeneity. Full two-dimensional analyses are performed within the context of a viscoplasticity theory which, in the rate independent limit, corresponds to flow theory with combined isotropic and kinematic hardening. Full account is taken of finite strain and rotation effects, but attention is confined to quasi-static loading. The initiation and propagation of shear bands is examined for the bounding theories of isotropic and kinematic hardening. The predicted response depends significantly on the multi-axial hardening characterization of the solid. GRA

FEASIBILITY STUDY OF TEST PROBLEMS FOR FINITE ELEMENT/FINITE DIFFERENCE PROGRAMS FOR STRUCTURAL DYNAMICS Final Technical Report, 1 Aug. 1985 - 31 Jan. 1986
P. S. Symonds and H. Kolsky 12 Mar. 1986 12 p
(Contract DAAG29-85-K-0201)
(AD-A169058; ARO-23225.1-EG) Avail: NTIS HC A02/MF A01 CSCL 13/13

This research has resulted in additional calculations which will provide essential guides to future work. Using the Shanley model as a cheap and effective tool, calculated results show the influence of the geometrical parameter eta (= thickness of sandwich beam/half span) and of damping. It is seen that the anomalous behavior occurs only in a small range of thickness. Damping changes the response behavior fundamentally: counter-intuitive behavior still occurs but in a much more irregular manner, suggestive of chaotic behavior. Calculations using ABAQUS for the pinned uniform beam of standard dimensions and for a test specimen of slightly different dimensions show the characteristic diagrams for the two cases. It is surprising that qualitatively different shapes are obtained for the critical range of loads. The anomalous behavior being studied is evidently sensitive to parameters in unexpected ways. GRA

A FINITE ELEMENT METHOD FOR LOCALIZED FAILURE ANALYSIS
Michael Ortiz, Yves Leroy, and Alan Needleman 15 Apr. 1986 43 p
(Contract N00014-85-K-0720; Grant NSF NSM-84-19338)
(AD-A169117) Avail: NTIS HC A03/MF A01 CSCL 12/1

A method is proposed which aims at enhancing the performance of general classes of elements in problems involving strain localization. The method exploits information concerning the process of localization which is readily available at the element level. A bifurcation analysis is used to determine the geometry of the localized deformation modes. When the onset of localization is detected, suitably defined shape functions are added to the element interpolation which closely reproduce the localized modes. The extra degrees of freedom representing the amplitudes of these modes are eliminated by static condensation. The proposed methodology can be applied to 2D and 3D problems involving arbitrary rate-independent material behavior. Numerical examples demonstrate the ability of the method to resolve the geometry of localized failure modes to the highest resolution allowed by the mesh. Author (GRA)

INFLUENCE OF SHEAR MODULUS ON THE BEHAVIOR OF ACOUSTICALLY TRANSPARENT MATERIALS Interim Report, 9 Jan. 1984 - 12 Jan. 1985
Pieter S. Dubbelday 30 Apr. 1986 16 p
(AD-A169289; NRL-MR-5745) Avail: NTIS HC A02/MF A01 CSCL 17/1

Materials are under construction that match the density, rho and dilatational sound speed, c as closely as possible to the values of seawater, while maintaining sufficient rigidity to serve for structural purposes. The demand for rigidity implies a larger shear modulus than is typical for the usual rho-c elastomers. Matching of density and sound speed results in transparency for fluids only; the finite shear modulus in a solid admits the presence of a shear wave, which causes deviation from ideal rho-c behavior. In this report the effect is analyzed of a finite shear modulus on the reflection of plane waves by an infinite plate of the rho-c material. Examples are given of the reflection coefficient as a function of incidence angle for various combinations of density and sound speed close to ideal, and various ratios of plate thickness to dilatational wavelength. The effect of a finite loss factor in the shear modulus is known. GRA

STRESS ASSISTED DIFFUSION IN ELASTIC AND VISCOELASTIC MATERIALS
Y. Weitsman Nov. 1985 37 p
(Contract N00014-82-K-0562)
(AD-A169296; MM-4762-85-19) Avail: NTIS HC A03/MF A01 CSCL 11/9

The governing field equations and boundary conditions for stress assisted diffusion are derived from basic principles of continuum mechanics and irreversible thermodynamics. Attention is confined to elastic and viscoelastic material response, with emphasis on isotropy and the case of small strains. It is shown that both the diffusion process and the saturation levels are stress dependent. In viscoelastic materials the time-dependence of the moisture boundary condition causes the saturation level to drift with time. In addition, the diffusion process becomes nonlinear in stress, in spite of the linearity of the mechanical behavior. GRA

MAGNA (MATERIALLY AND GEOMETRICALLY NONLINEAR ANALYSIS). ADDENDUM 1, PARTS 1-4 Final Report, Sep. 1982 - Mar. 1984
R. A. Brockman May 1986 191 p
(Contract F33615-82-K-3402)
(AD-A169383; AFWAL-TR-82-3098-ADD-1) Avail: NTIS HC A09/MF A01 CSCL 20/11

The finite element program MAGNA (Materially And Geometrically Nonlinear Analysis), has been developed for nonlinear static and dynamic analysis of complex three dimensional structures. This program is applicable to large structural response problems involving bars, membranes, beams, plates, shells, and three dimensional solids, experiencing large displacements, finite strains, large rotations, and plastic deformation. This revision package reflects a number of additions and modifications to the MAGNA software. These include the migration of CDC program versions from NOS/BE to the NOS operating system, conversion of source code to FORTRAN-77 (ANSI X3.9-1978), elimination of file naming and numbering conflicts among different program options, usage of CRAY COS V1.11 lk which is compatible with both CRAY-1 and CRAY-X/MP computers, conversion to IBM computers under the OS/VS2 MVS operating system, modification of VAX/VMS and CRAY restart options, addition of a cyclic symmetry feature in natural frequency analysis with an option for static condensation. INTRINSIC SIO2 FILM STRESS MEASUREMENTS ON THERMALLY OXIDIZED SI Interim Report
E. Kobeda and E. A. Irene 20 Jun. 1986 28 p
(Contract N00014-83-K-0571)
(AD-A169602; TR-7) Avail: NTIS HC A03/MF A01 CSCL 07/4

We have investigated the effects of varying Si oxidation conditions on intrinsic film stress for SiO2 films formed on Si. This study includes stress measurements on four Si orientations: (100), (110), (111), and (311); at oxidation temperatures ranging from 700 to 1100 C; wet (H2O) vs. dry (O2) oxidations for (100) and (111) surfaces; and the effects of post-oxidation annealing on stress. We find an orientation dependence for intrinsic stress which scales in the following manner: (110) > (311) > (100) > (111); a reduction in stress for wet vs. dry studies; and an even larger reduction for post-oxidation anneals. A recently proposed step model seems to account for the differences in stress with Si orientation. A number of Si oxidation models based on intrinsic stress are compared in their ability to describe the observed behavior, and we conclude that within the Deal-Grove oxidation model, the linear rate constant is strongly influenced by stress in the initial regime while stress is also likely to be important for thicker films. GRA

COMPUTATION OF THE AMPLITUDE OF STRESS SINGULAR TERMS FOR CRACKS AND REENTRANT CORNERS Final Report
Barna A. Szabo and Ivo Babuska Feb. 1986 35 p
(Contract N00014-85-K-0169; Grant AF-AFOSR-0315-82)
(AD-A169796; AD-E900585; WU/CCM-86/1) Avail: NTIS HC A03/MF A01 CSCL 20/11

The theoretical basis and performance characteristics of two new methods for the computation of the coefficients of the terms of asymptotic expansions at reentrant corners from finite element solutions are presented. The methods, called the contour integral method and the cutoff function method, are very efficient: The coefficients converge to their true values as fast as the strain energy, or faster. In order to make the presentation as simple as possible, we assume that the elastic body is homogeneous and isotropic, is loaded by boundary tractions only and, in the neighborhood of the reentrant corner, its boundaries are stress free. The methods described herein can be adapted to cases without such restrictions. GRA

COMPUTATION OF RESIDUAL STRESSES DUE TO PHASE TRANSFORMATIONS DURING QUENCHING OF HOLLOW CYLINDERS Final Report
J. D. Vasilakis Jul. 1986 39 p
(AD-A170493; ARCCB-TR-86024) Avail: NTIS HC A03/MF A01 CSCL 20/11

A previous paper described a method for computing the stresses due to the combined effects of transient temperatures and material phase transformations. The general purpose finite element program ADINAT/ADINA was used to compute both the transient temperatures and the associated stresses. The problem considered was that of an axisymmetric hollow cylinder undergoing a water-spray quench. The present work considers a similar model, but is better able to describe the residual stress state because of the availability of a more accurate set of properties for the material expansion due to the phase transformation. Effects on the transient and residual stresses due to modifications of the material expansion and varying quench rates are discussed. It was found that the stresses due to the transformation are more severe than those due to the transient temperatures alone. Inelastic behavior is found to occur in all the cases considered and high residual stresses can exist on the inner and outer surfaces. While dependent on actual material composition, these residual stresses can lead to quench cracking. The model describes the rapid quenching of steel gun tubes for the purpose of developing a martensitic grain structure and desired physical properties in the tube. GRA

UNLOADING-COMPLIANCE AND LOAD-DROP ANALYSIS OF J(Ic) TEST OF IRRADIATED 348 STAINLESS STEEL Final Technical Report
J. H. Underwood, F. M. Haggag, and W. G. Reuter Jun. 1986 31 p
(AD-A170494; ARCCB-TR-86021) Avail: NTIS HC A03/MF A01 CSCL 11/6

Procedures for determining J integral fracture toughness were applied to load versus load-line displacement data from a series of three point bend specimens of irradiated 348 stainless steel tested at 23 C and 427 C. ASTM Method E813 for J sub Ic was emphasized, using both unloading-compliance and load-drop measures of crack growth. An effective modulus procedure was included in the unloading compliance method using recently published load line displacement results. Two procedures were used for calculating J sub Ic from the J versus unloading compliance crack growth plots: the linear fit procedure from E813 and a power law fit with a 0.2 mm offset value of J sub Ic. Based on the results of these various procedures, conclusions were reached regarding the most consistent measures of fracture toughness from these data. Suggestions were given regarding the use of effective modulus with unloading compliance measurement of crack growth and the limitations of the load drop method for measuring crack growth. GRA

ASSESSMENT OF DAMAGE TOLERANCE REQUIREMENTS AND ANALYSES: A USER'S MANUAL FOR CRACK GROWTH AND CRACK INITIATION ANALYSIS: DAMGRO Final Report, Sep. 1982 - May 1986
Mier Levy and Albert Kuo 31 May 1986 142 p
Contract F33615-82-C-3215)
AD-A171209; AFWAL-TR-86-3028) Avail: NTIS
HC A07/MF A01 CSCL 01/3

A structural test program of typical aircraft structural configurations was conducted to assess the current Air Force damage tolerance design requirements defined in MIL-A-83444. The specimens, made of 2024-T3XX and 7075-T6XX, were subjected to randomized flight-by-flight spectra, representative of fighter/trainer and bomber/cargo type loading spectra, respectively, and to a constant amplitude loading spectrum. A total of two-hundred fifty-six specimens were tested. The test results were correlated with analytical predictions using crack growth and crack initiation methods. As a result of this study, recommendation is provided to the validity of MIL-A-83444, to develop guidelines for selection of critical crack locations, and to assess the state-of-the art analytical capabilities in predicting crack growth and crack initiation time. This report presents the user's manual of the computer program DAMGRO. This program has been developed in conjunction with this contract, and used to predict the crack growth and crack initiation of the structural test specimens. Author (GRA)

INFLUENCE OF EXPERIMENTAL SCATTER ON THE ANALYSIS AND EXTRAPOLATION OF STRESS-RUPTURE DATA
J. K. Booker 1986 24 p Presented at the ASME Pressure Vessel and Piping Conference and Exhibit, Chicago, Ill., 20 Jul. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009510; CONF-860722-10; CONF-860727-3) Avail: NTIS
HC A02/MF A01

A great deal of research has been performed in the area of analysis and extrapolation of stress rupture data for more than three decades. Most of this work has concentrated on development of clever model forms for describing behavior in a simple mathematical way. However, little direct consideration has been given to the importance of inherent data scatter for such analyses. This paper presents a direct discussion of that topic, including an illustration of the impact of data scatter for several computer simulated data sets for which true behavior and the true amount of scatter are known by definition. The results clearly indicate that less attention should be paid to development of clever model forms for fitting data, and more should be paid to the use of sound, valid statistical techniques for the fitting of whatever models are used. SHOCK-INDUCED SOLID STATE CHEMISTRY: THEORETICAL BACKGROUND
Nellori Jun. 1986 63 p
(Contract DE-AC04-76DP-00789)
(DE86-012741; SAND-86-0922) Avail: NTIS HC A04/MF A01

This report is a survey of the theoretical background of solid state chemistry relevant to high pressure shock wave loading. It is intended to be a study of selected theoretical concepts which are important for laying a foundation to make quantitative predictions concerning shock-induced chemical processes in nonenergetic solids. Since solid state reactions are often quite complex even under static conditions, the report is not intended to offer quick solutions to the very complex, and sometimes ill defined problems, but is to build a perspective to gain theoretical insight into some of them. The plan of the report is as follows: In Section 2, we collected a few relationships about chemical reactions from classical thermodynamics. In Section 3, we reviewed the nonequilibrium solid states created under shock wave loading with special focus on defects and heat and mass transport. Section 4 deals with selected concepts that may be useful to cope with reactions that result from the highly defective nonequilibrium states. Section 5 discusses several approaches for integrating microscopic mechanisms into continuum framework. Section 6 contains some recommendations for future research. DOE

HC A02/MF A01

We have used the molecular dynamic simulation technique in studying a variety of solid state problems, ranging from equation-of-state and shock wave propagation to epitaxy and various aspects of crack propagation. In these simulations, which are classical, Newton's equations-of-motion are solved for each particle at every step to yield positions, velocities, forces and energies. An important limitation of the technique is that one has to put an interatomic potential into the calculation. Within these restrictions the technique is exact and is very powerful in automatically incorporating many body and anharmonic effects into the calculation. For complicated processes, such as crack propagation, there is a practical limitation to two dimensions, simply by the availability of computing capabilities, if a large enough sample, representative of bulk processes is to be used. CRACK PROPAGATION IN HIGH STRAIN REGIONS OF A STEEL CONTAINMENT
F. Fanous and L. Greimann 1986 15 p Presented at the 3rd Workshop on Integrity of Containments for Nuclear Power Plants, Washington, D.C., 21 May 1986
(Contract W-7405-eng-82)
(DE86-011437; IS-M-578; CONF-860507-8) Avail: NTIS
HC A02/MF A01

During a severe accident, a containment may develop a controlled relatively small leak before the pressure reaches the point where general rupture of the shell occurs. Another hypothesis states that an overall failure will occur with total release of the vessel contents. This work represents a preliminary study to predict crack propagation from an initially small defect in a high strain location in a typical steel containment. The J integral approach is used. A virtual crack extension method for calculating J is developed for use with general finite element programs. Two through cracks with different lengths were found to be unstable at the pressure which caused a surface crack to propagate through the containment thickness. In other words, the resulting through crack will not be stable and general failure will occur with the almost instantaneous release of the vessel contents. DOE

DATA REQUIREMENTS TO MODEL CREEP IN 9Cr-1Mo-V STEEL

R. W. Swindeman 1986 7 p Presented at the 3rd Symposium on Nonlinear Constitutive Relations for High Temperature Applications, Cleveland, Ohio, 11 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-011754; CONF-8606138-2) Avail: NTIS HC A02/MF A01

Models for creep behavior are helpful in predicting response of components experiencing stress redistributions due to cyclic loads, and often the analyst would like information that correlates strain rate with history assuming simple hardening rules such as those based on time or strain. On the other hand, much progress has been made in the development of unified constitutive equations that include both hardening and softening through the introduction of state variables whose evolutions are history dependent. Although it is difficult to estimate specific data requirements for general application, there are several simple measurements that can be made in the course of creep testing and results reported in data bases. The issue is whether or not such data could be helpful in developing unified equations, and, if so, how should such data be reported. Data produced on a martensitic 9Cr-1Mo-V-Nb steel were examined with these issues in mind. DOE

USING COMBINED EXPERIMENT/ANALYSIS TO GENERATE DYNAMIC CRITICAL STRESS INTENSITY DATA
D. V. Swenson and A. R. Ingraffea 1986 34 p Presented at the 19th National Symposium on Fracture Mechanics (ASTM), San Antonio, Tex., 30 Jun. 1986 Prepared in cooperation with Cornell Univ.
(Contract DE-AC04-76DP-00789)
(DE86-013578; SAND-86-1337C; CONF-860675-3) Avail: NTIS HC A03/MF A01

In this paper, we give a short description of a finite element model of mixed-mode dynamic crack propagation. We then discuss the use of combined experiment/analysis procedures to generate critical stress intensity data as a function of crack velocity. Because of the sensitivity of the analysis to boundary conditions and specified crack velocity, it is difficult to generate reliable K sub ID (v) data using this approach. This is due to uncertainties in both the analysis and measured crack position. Suggestions are made for alternate test methods to reduce some of these uncertainties. DOE

METEOROLOGICAL EFFECTS OF GEOTECTONIC PHENOMENA HYPOTHESIZED Abstract Only c47
G. Afanasyev *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 2 p Transl. into ENGLISH from Sovetskaya Litva (Riga, USSR), 27 Apr. 1986 p 2 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

When meteorological data for several years in succession are carefully analyzed: heightened or lowered atmospheric pressures are observed more frequently over certain regions of the planet than others, at which cyclones and anticyclones originate. The natural conclusion, is that the source of the weather is located in the depths of the planet, in its mantle. This hypothesis was advanced at a conference on geotectonics which took place in the USSR. When the mantle interacts with the earth's core, so-called mantle channels form. They are fluctuating columns of matter 25 to 30 kilometers in diameter and 2,900 kilometers tall. This leads to the appearance of gravitational anomalies which are too weak to affect molecules of air directly, but they are quite sufficient to alter, by 1,000 times or more, the concentration of aerosols-droplets of water about 0.2 micrometer in diameter which are suspended in the air. These aerosols are condensation centers for water vapors, and their concentration directly affects the weather, as meteorologists demonstrated long ago. If the concentration changed in a certain place, the heatbalance of the atmosphere also changed there; areas heightened or lowered pressure occurred, and a cyclone or anticyclone was formed. E.R.

THIRD INTERNATIONAL SYMPOSIUM ON TROPICAL METEOROLOGY Abstract Only c47
V. N. Ivanov *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Izvestiya Akademii Nauk SSSR: Fiziki Atmosfery i Okeana (Moscow, USSR), v. 22, no. 2, Feb. 1986 p 221-223 Symposium held in Yalta, 24-31 Mar. 1985 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

The Third International Symposium on Tropical Meteorology was held at Yalta. The 100 specialists present represented scientific institutes in the USSR, Cuba and Vietnam. Twelve special reports and 18 other communications were presented on the subject of tropical meteorology and hurricane research. The subjects dealt with included prediction of the trajectories of tropical cyclones, generation and development of tropical cyclones, numerical and laboratory modeling of tropical cyclones, structure and energetics of tropical cyclones, clouds and artificial inducement of precipitation. Three types of prognostic models (hydrodynamic, statistical and semiempirical) were discussed. Author

DESERTIFICATION: GLOBAL ECOLOGICAL PROBLEM Abstract Only c46
N. S. Orlovskiy *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 2 p Transl. into ENGLISH from Voprosy Filisofii (Moscow, USSR), no. 2, Feb. 1986 p 113-123 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

It is suggested that western practices and analyses of desertification fail to take social factors into account, and do not promote progressive technology that would preserve the environment while bringing progress. It is claimed that Soviet practices

have minimized ecological damage by use of a different socioeconomic structure and by planning. In Central Asia, efforts since the 1930's have focused on controlling shifting sands with both dry grass and brush, as well as physicochemical means. In Turkmenistan sand dune damage to irrigated fields is completely controlled, although some local areas of desertification have been noted near well sites and in industrialized desert areas. Prevention of land damage in irrigated areas has required careful drainage system construction to avoid mineral deposits while making maximum use of ground water reserves. Technological backwardness is noted in some irrigated areas of Central Asia, and the extent of saline soils of various types is of concern. Disposal of irrigation water after its use is another problem still being resolved in Central Asia. Irrigation and water disposal in the basins of Syrdarya, Amudarya and Ili Rivers have caused a decline in the level of the Aral Sea. In addition, lands in the deltas of the Syrdarya and Amudarya have suffered desertification.

EVALUATING NONLINEAR EFFECTS IN PROPAGATION OF ACOUSTIC PULSE IN ATMOSPHERIC SURFACE LAYER IN INVERSIONS Abstract Only **c71**
I. P. Chunchuzov *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 2 p Transl. into ENGLISH from Izvestiya Akademii Nauk SSSR: Fizika Atmosfery i Okeana (Moscow, USSR), v. 22, no. 2, Feb. 1986 p 151-159 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

The general features of propagation of powerful acoustic disturbances in the atmospheric surface layer were analyzed. They can be generated by natural sources, such as volcanic eruptions, earthquakes and thunderstorms or by such artificial sources as powerful exlosions. An attempt was made to clarify the contribution made by nonlinear effects to the process of propagation of powerful acoustic disturbances in a surface waveguide. It is shown that in some cases such a nonlinear process of waveguide propagation of sound can be described by a nonlinear equation which is a nonlinear analogue of the well-known parabolic equation. Proceeding on this basis, it is shown that in the case of a point source nonlinear effects and waveguide dispersion can result in the appearance of cylindrical solitons at great distances which attenuate with distance far more slowly than a linearly propagated pulse. An equation is derived whose solution describes ow change of the initially plane soliton in the course of propagaion.

EXPERIMENTAL RESEARCH ON TURBULENCE IN UPPER-LEVEL TROPOSPHERIC CLOUDS Abstract Only **c46**
. K. Dmitriyev, T. P. Kapitanova, V. D. Litvinova, N. Z. Pinus, G. . Potertikova, and G. N. Shur *In its* USSR Report: Earth Sciences IPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH om Izvestiya Akademii Nauk SSSR: Fizika Atmosfery i Okeana Moscow, USSR), v. 22, no. 2, Feb. 1986 p 143-150 (For primary ocument see N87-12946 04-42)
vail: NTIS HC A06/MF A01

Flight studies of turbulence in cirrus clouds were made in late 981 and early 1982. The experiments were carried out with a de array of scientific instrumentation for measuring mean mperature, humidity, wind velocity and direction, fluctuations of mperature and the horizontal and vertical components of the nd vector. Parameters were measured in two ranges of spatial ales of disturbance (from hundreds of meters to 2 to 3 km and m 5 to 6 to 30 to 40 km). The two ranges correspond to ro- and mesoscale pulsations. Horizontal flights with a length to 500 km were made at 5 to 6 levels. Nineteen multilever nt experiments were made. Flights were made in cirrostratus uds and in the clear sky. The collected data were used in structing vertical atmospheric sections and in tabulating the ults of synchronous measurements of the vertical and horizontal tuations of velocity and temperature fluctuations, rate of ipation of turbulent energy into heat, rate of evening-out of perature inhomogeneities and structural characteristic of the fluctuating temperature field. This made it possible to define the distinguishing characteristics of turbulence in cirrostratus clouds and in jet streams.

SOLAR CONTROL OF GEOPHYSICAL PHENOMENA Abstract Only **c46**
V. F. Loginov and G. V. Fedorovich *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Zemlya i Vselennaya (Moscow, USSR), no. 1, Jan. - Feb. 1986 p 58-61 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

An all-union conference on Interrelationship of Meteorological Phenomena and Processes in Circumterrestrial Space was held in Moscow. The purpose was a review of progress in study of different mechanisms of interrelationships of geophysical and meteorological processes and phenomena in the upper atmosphere and in space. The change in the influx of solar radiation to the Earth during the last century was studied. On the basis of data on parameters of the Earth's orbit and brightness of the solar disk they concluded that the influx of solar radiation is decreasing not only due to a change in the brightness of the solar disk, but also due to a change in the parameters of the Earth's orbit with a duration from several years to several decades. Changes in composition and temperature of the ozone layer under the influence of UV radiation and cosmic rays was discussed. Although ozone for the most part is found in the lower and middle stratosphere and solar flares have little effect on its total content, there is good basis for assuming that the ozone mechanism plays a definite role in changes in weather and climate. The role was also studied of the Earth's electrical field in solar-terrestrial relationships, which plays an important role in the propagation of disturbances in the circumterrestrial medium and must be taken into account in studying the process of preparation of earthquakes.

EFFECT OF PULSATING AURORAS ON FREQUENCY-TIME CHARACTERISTICS OF RADIO SIGNALS REFLECTED FROM AURORAL IONOSPHERE Abstract Only **c32**
A. A. Arykov, I. N. Bardeyev, A. N. Vasilyev, V. G. Korotkov, A. M. Royzen, and S. A. Rumyantsev *In its* USSR Report: Earth ScienceS (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Geomagnetizm i Aeronomiya (Moscow, USSR), v. 26, no. 2, Mar. - Apr. 1986 p 243-246 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

The spectrum of constant wave radio signals reflected and dissipated by the ionosphere can provide much information about processes in the ionosphere. Experimental study of dynamics of spectral variations of radio signals reflected from the auroral ionosphere during periods of pulsating auroras is reported. The experiments were conducted on a 60 km path at a geomagnetic latitude averaging 63 deg. A constant signal with plane polarization was sent at 3.3 MHz. Analysis of experimental data show that the undisturbed signal, in a band of several Hz around the working frequency, was expanded noticeably in amplitude by the aurora disturbances. Optical pulsations and spectral variations support the explanation of spectral variations as a result of Doppler frequency shifts and changes in electron concentration profiles. Auroras with an interval of about 10 seconds were accompanied by specific variations in SW radio signals reflected in the E region of the auroral ionosphere. Spectral variations are explained by the Doppler shift of signal frequency during changes in ionization density created by rapidly changing currents of precipitating electrons during pulsating auroras.

PHASE FLUCTUATIONS OF IONOSPHERE RADIO SIGNALS Abstract Only **c32**
V. D. Gusev and M. B. Vinogradova *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 2 p Transl. into ENGLISH from Geomagnetizm i Aeronomiya (Moscow, USSR),

v. 26, no. 2, Mar. - Apr. 1986 p 247-252 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

Phase fluctuations were observed in reflections of radio signals in regions of the ionosphere containing various inhomogeneities. While these fluctuations affect operations of radio systems, they also offer new information about the structure and dimensions of scattering inhomogeneities. Geometric optics are used for correct expression of wave phase reflections from the ionosphere during oblique propagation. Calculations take account of dielectric permeability and beam trajectories. A second series of calculations related to determination of phase fluctuations of waves during propagation in a fixed-thickness layer with slant incidence relative to the boundary. Fluctuations of horizontal beam shift at the output from the distributive layer are also treated mathematically. Results indicate that ionosphere inhomogeneities can be used to determine dielectric properties of materials. Author

TRANSVERSE RESONANCES OF EARTH-IONOSPHERE WAVE GUIDE IN AURORAL REGION Abstract Only c32
V. S. Smirnov and A. A. Ostapenko *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Geomagnetizm i Aeronomiya (Moscow, USSR), v. 26, no. 2, Mar. - Apr. 1986 p 253-257 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

Contemporary studies of low freqeuncy radiation have defined the precise structure of such signals in the auroral region. A study is reported of spectral and polarized features of transverse resonances and the relationship to ionospheric parameters. So-called Schumann resonances were studied with frequencies from a few to tens of Hz. Strong attenuation in that range virtually excludes wave interference and makes it difficult to generate global resonances in the kiloherz frequency range. Thus, modulations in those frequencies are local in nature. They make it possible to use a plane model of the earth-ionosphere wave guide and allow direct determination of the wave equation, which is discussed. Results show that at high latitude degeneration effects are manifested in periods of leakage of hard particles when the ionosphere is at low altitudes; soft particles are found when the ionosphere limits are at higher altitudes. A stepped mathematical model gave a rough approximation of actual ionization. Ordinary and extraordinary modes were found to correspond to waves of left and right polarization, respectively, with relatively low values for particle disintegration. Theoretical values correlated well with experimental data on low-frequency radiation wave. Author

REGULAR NOISE BACKGROUND IN VLF-RADIATION AND WORLD THUNDERSTORM CENTERS Abstract Only c32
G. I. Druzhin, T. V. Toropchinova, and V. I. Shapayev *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Geomagnetizm i Aeronomiya (Moscow, USSR), v. 26, no. 2, Mar. - Apr. 1986 p 258-264 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

Regular noise emissions (RNE) in VLF radiations are typified by their constant nature. Attempts to develop qualitative analysis procedures for defining various sources in the RNE amplitude by observing the day-long course of intensity at several recording stations are reported. Signal azimuth findings were made using a magnetic dipole antenna. A preliminary hypothesis held that only two sources, discrete and isotropic points, contributed to RNE amplitude. Actually, it was found that two or more sources could be involved simultaneously. Errors for three factors are discussed: the RNE source with extreme limits, several simultaneous discrete sources and measurement error parameters. Varying evening and nighttime readings were recorded, with minor morning changes as well. They were found at all recording stations. Quasi-constant azimuths of radiation during definite periods indicate that localized RNE sources should exist during these periods. During fall and winter periods, world thunderstorm cells were found to play a key role in RNE formation, but further research is needed to determine whether thunderstorm activity alone accounts for RNE generation. SPATIAL RADIO WAVE ATTENUATION DURING VERTICAL SOUNDING OF IONOSPHERE Abstract Only c32
P. F. Denisenko, V. I. Vodolazkin, and G. G. Vertogradov *In its* USSR Report: Earth Sciences (JPRS-UES-86-007) 10 Sep. 1986 1 p Transl. into ENGLISH from Geomagnetizm i Aeronomiya (Moscow, USSR), v. 26, no. 2, Mar. - Apr. 1986 p 322-325 (For primary document see N87-12946 04-42)
Avail: NTIS HC A06/MF A01

Radio wave attenuation due to energy losses in the ionosphere was studied. The field is expressed by the equation: E = A exp(-L sub e/r sub eff). It concentrates on determining the effective distance in the actual ionosphere in relation to an illuminated area of the earth's surface. The vector of the inverse geomagnetic field strength effect is also included in the mathematical model. It is noted that the results are reliable for all but the longitudinal propagation of regular radio waves. Corrections are suggested. The method has a correctable level of error. Author

GEOLOGIC REMOTE SENSING AT INPE: AN OVERVIEW
Chan Chiang Liu, Jose Eduardo Rodrigues, and Paulo Roberto Martini Aug. 1986 18 p Presented at the Seminar on Geologic Applications of Remote Sensing, Sao Jose dos Campos, Brazil, Dec. 1985
(INPE-3975-PRE/987) Avail: NTIS HC A02/MF A01

In Brazil, LANDSAT imagery has been used for regional geological and mineral resources mapping. The launching of the first LANDSAT is a milestone in the history of geological surveys by remote sensing techniques in this country. Because LANDSAT images give a bird's eye view of the earth's surface, this regional geological mapping has been carried out first, and then followed by structural and geotectonic studies. On the other hand, because LANDSAT data in digital format on Computer Compatible Tapes (CCT) are available to be analyzed by computer-processing techniques, research for mineral deposits and rock formation identification have been possible especially in recent years. EVALUATION OF REMOTE SENSING TECHNIQUES TO THE DETECTION OF CHANGES IN A FLUVIAL SYSTEM DUE TO HUMAN INFLUENCE: THE EXAMPLE OF CANAS RIVER BASIN (SAO PAULO STATE, BRAZIL)
Evlyn M. L. M. Novo and Adilson Avansi deAbreu (Sao Paulo Univ. (Brazil).) Aug. 1986 36 p Submitted for publication
(INPE-3970-PRE/983) Avail: NTIS HC A03/MF A01

The main objective of this study is to exemplify the use of remote sensing data to evaluate human interference in fluvial systems. River Canas Basin was selected as a test site since it belongs to the Paraiba River basin where human action has disrupted natural equilibrium. Multitemporal aerial photography was analyzed so as to detect changes in fluvial morphology. The rate of environmental change was checked against remote sensing data available by using field work information. Results permitted identification river channel changes over time as well as local factors which explain the variability of change rates. Author

ROP YIELD MODELING FOR CLIMATE IMPACT STUDIES. ART 1: REASONING AND RESULTS

austo Carlos deAlmeida Aug. 1986 12 p Presented at the ASA Meeting on Assessment of Climate Impact on Agriculture in emiarid and High Altitude Regions, Laxenburg, Austria, 8-12 Oct. 984

NPE-3967-PRE/982-Pt-1) Avail: NTIS HC A02/MF A01

The use of regression crop yield models (RCY) for Climate pact Assessment Studies requires some basic features some-nes not encountered in most RCY models. Many of the RCY odels developed have a different aim, i.e., to give a reasonable timate of the yield of a given crop, for a given location, based a historical technological trend and suitably chosen meteorologi-l variables. In general they offer good prediction efficacy, i.e., curacy and lead time, but should be carefully analyzed when ed for other purposes, such as in Climate Impact Assessment udies. Depending on what kind of climate scenario we are dealing h, the RCY model chosen has to be able to assimilate the pact of the respective meteorological variables on yield. For , the model should be representative, i.e., should not depend the historical time series period we chose to work with. Its ression coefficients should be stable with no change in sign l present a very small (combined) variance, otherwise the climate ect, represented by changes of the meteorological variables ng tested, can be masked by its (the regression coefficients) ance.

ERGY RECEIPT PARTITIONING OVER THE AMAZON FOR-

nardo DeanedeAbreuSa, Yelisetty Viswanadham, and Antonio mar Manzi Aug. 1986 46 p Submitted for publication

E-3980-PRE/990) Avail: NTIS HC A03/MF A01

The present study involved determination of the experimental rgy receipt partitioning over the tropical Amazon forest. Diurnal ation of net radiation (Q*), sensible heat flux (Q sub H) and t heat flux (Q sub E) is presented. The daytime Q sub E is in e with Q* and it is always an important term in the energy nce. The daily averaged Q sub E is 59 to 100% of the daily whereas Q sub H is 5 to 28% at the Amazon forest site eg. 57 deg. S; 59 deg. 57 deg W) for the sample periods. results present evidence that Q sub E over the Amazon t is greater than Q* in the afternoon hours. The role of ible heat advection in maintaining large Q sub E over the t surface is discussed. Hourly Bowen ratio (beta) values for compaigns are presented. During daylight hours, the differ-s in beta are not significant, and exhibit a systematic pattern. only time that the variation in Bowen ratio increased signifi-y was a sunrise and sunset when the thermal structure of the as changing from a strong inversion to lapse and vice versa. diurnal beta values changed from -3.50 to 0.85. The mean beta calculated from values from 0700 to 1600h, varied 0.05 to 0.85.

TITION OF SENSIBLE AND LATENT HEAT FLUXES E THE TERRA FIRMA AREA IN THE AMAZON FOREST IENT METHOD) [PARTICAO DE FLUXOS DE CALOR VEL E DE CALOR LATENTE ACIMA DA FLORESTA AMAZONICA DE TERRA FIRME (METODO DOS GRADIEN-TES)]

Leonardo DeanedeAbreuSa, Antonio Ocimar Manzi, and Yelisetty Viswanadham Aug. 1986 18 p In PORTUGUESE; ENGLISH summary Presented at the 30th Reuaniao Anual da S.B.P.C., Curitiba, Brazil, 9-16 Jul., 1986

(INPE-3972-PRE/985) Avail: NTIS HC A02/MF A01

A partition of net radiation to sensible and latent heat fluxes above the Amazon Forest canopy is studied. The observational site (2 degrees 57 minutes S, 59 degrees W) of the Terra firma area in the Amazon forest is near Manaus, AM. The Bowen ratio values for distinct layers above the canopy are calculated using the profile method. Diurnal variation of these values are presented. The results show that the daytime Bowen ratios obtained during nonprecipiatation days for higher layer are greater than for lower layer. This may be attributed to the influence of this transpiration from adjacnt air layers above the canopy. This process reduces the temperature of the adjacent air layers above the canopy and increases the specific humidity in those layers. The data obtained for the period July 1984 to April 1985 were utilized in the analysis.

ERS-1 SAR DATA PROCESSING

Kon Leung, Thomas Bicknell, and Kenneth Vines 1 Sep. 1986 34 p

(NASA-CR-179913; JPL-Pub-86-33; NAS 1.26:179913) Avail: NTIS HC A03/MF A01 CSCL 05B

To take full advantage of the synthetic aperature radar (SAR) to be flown on board the European Space Agency's Remote Sensing Satellite (ERS-1) (1989) and the Canadian Radarsat (1990), the implementation of a receiving station in Alaska is being studied to gather and process SAR data pertaining in particular to regions within the station's range of reception. The current SAR data processing requirement is estimated to be on the order of 5 minutes per day. The Interim Digital Sar Processor (IDP) which was under continual development through Seasat (1978) and SIR-B (1984) can process slightly more than 2 minutes of ERS-1 data per day. On the other hand, the Advanced Digital SAR Processore (ADSP), currently under development for the Shuttle Imaging Radar C (SIR-C, 1988) and the Venus Radar Mapper, (VMR, 1988), is capable of processing ERS-1 SAR data at a real time rate. To better suit the anticipated ERS-1 SAR data processing requirement, both a modified IDP and an ADSP derivative are being examined. For the modified IDP, a pipelined architecture is proposed for the mini-computer plus array processor arrangement to improve throughout. For the ADSP derivative, a simplified version is proposed to enhance ease of implementation and maintainability while maintaing real time throughput rates. These processing systems are discussed and evaluated.

PHOTOGRAPHIC SENSORS: BASIC CONCEPTS [SENSORES FOTOGRAFICOS: CONCEITOS BASICOS]

Chan Chang Liu and Jose Eduardo Rodrigues Sep. 1986 43 p In PORTUGUESE; ENGLISH summary

(INPE-3990-MD/031) Avail: NTIS HC A03/MF A01

This paper of photographic systems is prepared for the Postgraduate course on Remote Sensing of the Instituto de Pesquisas Espaciais (INPE) and is suitable both as teaching material or as reference. It provides almost all aspects of photography, taking and processing photographs, physical factors affecting their quality, type of camera, films, filters and so on. This work is not exhaustive but is a summary of subjects extensively covered in the literature. Therefore, readers should be quickly able to understand and apply the photographic remote sensing techniques to their disciplines.

A COMPUTATIONAL METHOD TO MODEL RADAR RETURN

RANGE IN A POLYGONALLY BASED, COMPUTER-GENERATED-IMAGERY SIMULATION

F. J. Moran and J. D. Phillips Jul. 1986 22 p

(NASA-TM-88324; A-86313; NAS 1.15:88324) Avail: NTIS HC A02/MF A01 CSCL 08B

Described is a method for modeling a ground-mapping radar system for use in simulations where the terrain is in a polygonal form commonly used with computer generated imagery (CGI). The method employs a unique approach for rapidly rejecting polygons not visible to the radar to facilitate the real-time simulation of the radar return. This rapid rejection of the nonvisible polygons requires the precalculation and storage of a set of parameters that do not vary during the simulation. The calculation of a radar range as a function of the radar forward-looking angle to the CGI terrain is carried out only for the visible polygons. This method was used as part of a simulation for terrain-following helicopter operations on the vertical motion simulator at the NASA Ames Research Center. It proved to be an efficient means for returning real-time simulated radar range data. Author

RADIOMETRIC CALIBRATION OF THE AIRBORNE IMAGING SPECTROMETER c35

Deanne Tucker and Gregg Vane *In its* Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 17-20 (For primary document see N87-12968 04-43)

Avail: NTIS HC A10/MF A01 CSCL 14B

Several laboratory calibration tests were developed for the Airborne Imaging Spectrometer (AIS). The goals of these tests are to adjust the physical alignment of the detector within the optical system and set the spectral endpoints, and produce a calibration file of multipliers which equalizes the relative responses of each of the detector elements in the entire two-dimensional array. Tests are also performed as part of an ongoing effort to provide absolute radiometric calibration. The tests are described and the merits and limitations of each are discussed. Author

COMPARISON OF VARIOUS TECHNIQUES FOR CALIBRATION OF AIS DATA c35

Dar A. Roberts, Yasushi Yamaguchi (Geological Survey of Japan, Kawasaki.), and Ronald J. P. Lyon *In* JPL Proceedings of the Second Airborn Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 21-30 (For primary document see N87-12968 04-43)

Avail: NTIS HC A10/MF A01 CSCL 14B

The Airborne Imaging Spectrometer (AIS) samples a region which is strongly influenced by decreasing solar irradiance at longer wavelengths and strong atmospheric absorptions. Four techniques, the Log Residual, the Least Upper Bound Residual, the Flat Field Correction and calibration using field reflectance measurements were investigated as a means for removing these two features. Of the four techniques field reflectance calibration proved to be superior in terms of noise and normalization. Of the other three techniques, the Log Residual was superior when applied to areas which did not contain one dominant cover type. In heavily vegetated areas, the Log Residual proved to be ineffective. After removing anomalously bright data values, the Least Upper Bound Residual proved to be almost as effective as the Log Residual in sparsely vegetated areas and much more effective in heavily vegetated areas. Of all the techniques, the Flat Field Correction was the noisiest. Author

ANALYSIS OF AIS RADIOMETRY WITH EMPHASIS ON DETERMINATION OF ATMOSPHERIC PROPERTIES AND SURFACE REFLECTANCE

J. E. Conel, S. Adams, R. E. Alley, G. Hoover, and S. Schultz *In its* Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 31-51 (For primary document see N87-12968 04-43)

Avail: NTIS HC A10/MF A01 CSCL 05B

Airborne Imaging Spectrometer data from Mono Lake, California, were studied in order to establish spectral radiance of test areas under solar illumination. The objective is to provide a method of atmospheric correction for major absorbers from the spectrometer data themselves. Crucial to the analysis is radiometric calibration of the instrument. Good agreement is found between calculated and measured radiances for uniform surface targets (beaches), but simulations of atmospheric properties with LOWTRAN lead to unreasonably low values of atmospheric precipitable water. Absorptions from carbon dioxide are not detected in the AIS data, but are strongly present in the LOWTRAN model. The apparent low contrast of all atmospheric absorption bands leads to a study of contamination from overlapping spectral orders in the AIS data. The suspected contamination is shown unambiguously to be present beyond approximately 1500 nm and consists of an extra radiance term including atmospheric bands from the delta/2 wavelength interval. A rigorous removal of the unwanted spectral contamination does not seem possible for any data taken in the rock mode. Rough estimates for tree-mode observations might be pieced together is a suitable after-the-fact radiometric calibration of the instrument can be formulated. Author

AIRBORNE SPECTRORADIOMETRY: THE APPLICATION OF AIS DATA TO DETECTING SUBTLE MINERAL ABSORPTION FEATURES

Terry D. Cocks and Andy A. Green *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 52-62 (For primary document see N87-12968 04-43)

Avail: NTIS HC A10/MF A01 CSCL 05B

Analysis of Airborne Imaging Spectrometer (AIS) data acquired in Australia has revealed a number of operational problems. Horizontal striping in AIS imagery and spectral distortions due to order overlap were investigated. Horizontal striping, caused by grating position errors can be removed with little or no effect on spectral details. Order overlap remains a problem that seriously compromises identification of subtle mineral absorption features within AIS spectra. A spectrometric model of the AIS was developed to assist in identifying spurious spectral features, and will be used in efforts to restore the spectral integrity of the data. Author

ATMOSPHERIC-WATER ABSORPTION FEATURES NEAR 2.2 MICROMETERS AND THEIR IMPORTANCE IN HIGH SPECTRAL RESOLUTION REMOTE SENSING

Fred A. Kruse and Roger N. Clark *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 63-73 (For primary document see N87-12968 04-43)

Avail: NTIS HC A10/MF A01 CSCL 05B

Selective absorption of electromagnetic radiation by atmospheric gases and water vapor is an accepted fact in terrestrial remote sensing. Until recently, only a general knowledge of atmospheric effects was required for analysis of remote sensing

lata; however, with the advent of high spectral resolution imaging levices, detailed knowledge of atmospheric absorption bands has ecome increasingly important for accurate analysis. Detailed study f high spectral resolution aircraft data at the U.S. Geological urvey has disclosed narrow absorption features centered at pproximately 2.17 and 2.20 micrometers not caused by surface ineralogy. Published atmospheric transmission spectra and tmospheric spectra derived using the LOWTRAN-5 computer odel indicate that these absorption features are probably water apor. Spectral modeling indicates that the effects of atmospheric bsorption in this region are most pronounced in spectrally flat aterials with only weak absorption bands. Without correction and etailed knowledge of the atmospheric effects, accurate mapping surface mineralogy (particularly at low mineral concentrations) not possible. Author

ESTRIPING AIS DATA USING FOURIER FILTERING TECHQUES
ris Hlavka *In* JPL Proceedings of the Second Airborne Imaging ectrometer Data Analysis Workshop 15 Aug. 1986 p 74-80 or primary document see N87-12968 04-43)
ail: NTIS HC A10/MF A01 CSCL 05B
Airborne Imaging Spectrometers (AIS) data collected in 1984 d 1985 showed pronounced striping in the vertical and horizontal actions. This striping reduced the signal to noise ratio so that tures of the spectra of forest canopies were obscured or altered noise. This noise was removed by application of a notch filter the Fourier transform of the imagery in each waveband. Author

IPARISON OF THE 1984 AND 1985 AIS DATA OVER THE IATSE RANGE (YERINGTON), NEVADA
P. Lyon *In* JPL Proceedings of the Second Airborne Imaging trometer Data Analysis Workshop 15 Aug. 1986 p 86-95 primary document see N87-12968 04-43)
NTIS HC A10/MF A01 CSCL 05B
he Singatse Range is composed of a series of 53 types of nic, plutonic, metamorphic, and sedimentary rocks. In addition urassic plutonic rocks are also of economic interest for their r mineralization which is contained in a porphyry dike swarm. 1984 and 1985 flight results from the Airborne Imaging rometer (AIS) instrument flown in the NASA/JPL C-130 t are contrasted and compared. The 1984 data are less than the 1985, in which many sets of vertical stripings from etectors can be seen. Significantly however, enough of the hermal alteration patterns can be seen in each line at the crossing points that one can say that the specific targets detected in both year's flights. The spectra of both years rrupted by the second-order effect from the grating, but O-H bond absorption at essentially correct wavelengths for sericite and/or kaolinite can be seen. Author

IDENTIFICATION OF HYDROTHERMAL ALTERATION ASSEMBLAGES USING AIRBORNE IMAGING SPECTROMETER DATA
Sandra C. Feldman and James V. Taranik *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 96-101 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B
Airborne Imaging Spectrometer (AIS) data, field and laboratory spectra and samples for X-ray diffraction analysis were collected in argillically altered Tertiary volcanic rocks in the Hot Creek Range, Nevada. From laboratory and field spectral measurements in the 2.0 to 2.4 micron range and using a spectroradiometer with a 4 nm sampling interval, the absorption band centers for kaolinite were located at 2.172 and 2.215 microns, for montmorillonite at 2.214 micron and for illite at 2.205. Based on these values and the criteria for resolution and separtion of spectral features, a spectral sampling interval of less than 4 nm is necessary to separate the clays. With an AIS spectral sampling interval of 9.3 nm, a spectral matching algorithm is more effective for separating kaolinite, montmorillonite, ad illite in Hot Creek Range than using the location of absorption minima alone. DETECTION OF HYDROTHERMAL ALTERATION AT VIRGINIA CITY, NEVADA USING AIRBORNE IMAGING SPECTROMETRY (AIS)
Amy Hutsinpiller and James V. Taranik *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 102-108 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B
Airborne Imaging Spectrometer (AIS) data were collected over Virginia City, Nevada; an area of gold and silver mineralization with extensive surface exposures of altered volcanic rocks. The data were corrected for atmospheric effects by a flat-field method, and compared to library spectra of various alteration minerals using a spectral analysis program SPAM. Areas of strong clay alteration were identified on the AIS images that were mapped as kaolinitic, illitic, and sericitic alterations zones. Kaolinitic alteration is distinguishable in the 2.1 to 2.4 and 1.2 to 1.5 micrometer wavelength regions. Montmorillonite, illite, and sericite have absorption features similar to each other at 2.2 micrometer wavelength. Montnorillonite and illite also may be present in varying proportions within one Ground Instantaneous Field of View (GIFOV). In general AIS data is useful in identifying alteration zones that are associated with or lie above precious metal mineralization at Virginia City. Author

PRELIMINARY GEOLOGICAL INVESTIGATION OF AIS DATA AT MARY KATHLEEN, QUEENSLAND, AUSTRALIA
Jon F. Huntington, Andy A. Green, Maurice D. Craig, and Terry D. Cocks *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 109-131 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B
The Airborne Imaging Spectrometer (AIS) was flown over granitic, volcanic, and calc-silicate terrain around the Mary Kathleen Uranium Mine in Queensland, in a test of its mineralocial mapping capabilities. An analysis strategy and restoration and enhancement techniques were developed to process the 128 band AIS data. A preliminary analysis of one of three AIS flight lines shows that the data contains considerable spectral variation but that it is also contaminated by second-order leakage of radiation from the near-infrared region. This makes the recognition of expected spectral absorption shapes very difficult. The effect appears worst in terrains containing considerable vegetation. Techniques that try

to predict this supplementary radiation coupled with the log residual analytical technique show that expected mineral absorption spectra can be derived. The techniques suggest that with additional refinement correction procedures, the Australian AIS data may be revised. Application of the log residual analysis method has proved very successful on the cuprite, Nevada data set, and for highlighting the alunite, linite, and SiOH mineralogy. Author

NEAR-INFRARED DETECTION OF AMMONIUM MINERALS AT IVANHOE HOT SPRINGS, NEVADA
M. Dennis Krohn *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 138-144 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B

Airborne Imaging Spectrometer (AIS) data were collected over the fossil hot spring deposit at Ivanhoe, Nevada in order to determine the surface distribution of NH4-bearing minerals. Laboratory studies show that NH4-bearing minerals have characteristic absorption features in the near-infrared (NIR). Ammonium-bearing feldspars and alunites were observed at the surface of Ivanhoe using a hand-held radiometer. However, first look analysis of the AIS images showed that the line was about 500 m east of its intended mark, and the vegetation cover was sufficiently dense to inhibit preliminary attempts at making relative reflectance images for detection of ammonium minerals. ANALYSIS OF AIS DATA OF THE BONANZA CREEK EXPERIMENTAL FOREST, ALASKA
Michael A. Spanner and David L. Peterson *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 144-152 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B

Airborne Imaging Spectrometer (AIS) data were acquired in 1985 over the Bonanza Creek Experimental Forest, Alaska for the analysis of canopy characteristics including biochemistry. Concurrent with AIS overflights, foliage from fifteen coniferous and deciduous forest stands were analyzed for a variety of biochemical constituents including nitrogen, lignin, protein, and chlorophyll. Preliminary analysis of AIS spectra indicates that the wavelength region between 1450 to 1800 namometers (nm) displays distinct differences in spectral response for some of the forest stands. A flat field subtraction (forest stand spectra - flat field spectra) of the AIS spectra assisted in the interpretation of features of the spectra that are related to biology. Author

SOIL TYPES AND FOREST CANOPY STRUCTURES IN SOUTHERN MISSOURI: A FIRST LOOK WITH AIS DATA
Glen M. Green and Raymond E. Arvidson *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 153-161 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B

Spectral reflectance properties of deciduous oak-hickory forests covering the eastern half of the Rolla Quadrangle were examined using Thematic Mapper (TM) data acquired in August and December, 1982 and Airborne Imaging Spectrometer (AIS) data acquired in August, 1985. For the TM data distinctly high relative reflectance values (greater than 0.3) in the near infrared (Band 4, 0.73 to 0.94 micrometers) correspond to regions characterized by xeric (dry) forests that overlie soils with low water retention capacities. These soils are derived primarily from rhyolites. More mesic forests characterized by lower TM band 4 relative reflectances are associated with soils of higher retention capacities derived predominately from non-cherty carbonates. The major factors affecting canopy reflectance appear to be the leaf area index (LAI) and leaf optical properties. The Suits canopy reflectance model predicts the relative reflectance values for the xeric canopies. The mesic canopy reflectance is less well matched and incorporation of canopy shadowing caused by the irregular nature of the mesic canopy may be necessary. Preliminary examination of high spectral resolution AIS data acquired in August of 1985 reveals no more information than found in the broad band TM data. Author

PATTERNS OF VEGETATION IN THE OWENS VALLEY, CALIFORNIA
Susan L. Ustin (California Univ., Berkeley.), Barrett N. Rock, and Roy A. Woodward *In its* Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 180-186 (For primary document see N87-12968 04-43)
Avail: NTIS HC A10/MF A01 CSCL 05B

Spectral characteristics of semi-arid shrub communities were examined using Airborne Imaging Spectrometer (AIS) data collected in the tree mode on 23 May 1985. Mesic sites with relatively high vegetation density and distinct zonation patterns exhibited greater spectral signature variations than sites with more xeric shrub communities. Spectral signature patterns were not directly related to vegetation density or physiognomy, although spatial maps derived from an 8-channel maximum likelihood classification were supported by photo-interpreted surface features. In AIS data, the principal detected effect of shrub vegetation on the alluvial fans is to lower reflectance across the spectrum. These results are similar to those reported during a period of minimal physiological activity in autumn, indicating that shadows cast by vegetation canopies are an important element of soil-vegetation interaction under conditions of relatively low canopy cover. AIS SPECTRA OF DESERT SHRUB CANOPIES

Rjay Murray, Dennis L. Isaacson, Barry J. Schrumpf, William J. Ripple, and Anthony J. Lewis *In* JPL Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop 15 Aug. 1986 p 187-193 (For primary document see N87-12968 04-43) Avail: NTIS HC A10/MF A01 CSCL 05B

Airborne Imaging Spectrometer (AIS) data were collected 30 August 1985 from a desert shrub community in central Oregon. Spectra from artificial targets placed on the test site and rom bare soil, big sagebrush (Artemesia tridentata wyomingensis), silver sagebrush (Artemesia cana bolander), and exposed olcanic rocks were studied. Spectral data from grating position 3 tree mode) were selected from 25 ground positions for analysis y Principal Factor Analysis (PFA). In this grating position, as many s six factors were identified as significant in contributing to spectral tructure. Channels 74 through 84 (tree mode) best characterized etween-class differences. Other channels were identified as ondiscriminating and as associated with such errors as excessive tmospheric absorption and grating positin changes. The test site as relatively simple with the two species (A. tridentata and A. ana) representing nearly 95% of biomass and with only two ineral backgrounds, a montmorillonitic soil and volcanic rocks. as in this study, six factors of spectral structure can be extracted om a single grating position from data acquired over a simple egetation community, then AIS data must be considered rich in formation-gathering potential. The methodology used in the project Irrigated Crop Survey in Sao Paulo State and its main results are presented. The project developed through a joint agreement between INPE/MCT and DAEE/S.P. The Itatiba/Braganca Paulista (SP) test site was selected. Sequential TM/LANDSAT data were applied with the objective of evaluating the total irrigated area. Field data were collected which permitted comparison between two methods for irrigated area estimation: direct expansion model using only field data collected in sample segments, regression model combining ground information extracted from remote sensing products. The performance of TM composites TM 2 (BLUE); TM 3 (GREEN) and TM 4 (RED); TM 5 (BLUE); TM 3 (GREEN) and TM 4 (RED) were compared to identify the best mix to detect irrigated crops. The results demonstrated that a reduction of 94.02% in the estimated variance was obtained by using the regression model. The comparison of the increase of date-to-date irrigated area from May to October showed that the 3 first overpasses were sufficient to map some 90% of the total irrigated area. The performance of the TM composites were not significantly different in relation to its potential for detecting irrigated crops. Author

GENERATION OF IMAGES WITH RECORDED AUXILLARY DATA FOR THE LANDSAT THEMATIC MAPPER (TM) IMAGERY M. S. Thesis, Mar. 1985 [GERACAO DE IMAGENS COM DADOS AUXILIARES REGISTRADOS A IMAGENS TM—LANDSAT]

Jose Borges Escada, Jr. Sep. 1986 66 p In PORTUGUESE; ENGLISH summary

(INPE-3982-TDL/234) Avail: NTIS HC A04/MF A01

A system for storing and recovering auxiliary data is implemented so that the latter can be correlated with a given Thematic Mapper scene in a way that these auxiliary data can be treated as a Thematic Mapper image. The resources available at the Processing Subsystem of the Image Generation Department of INPE (Instituto de Pesquisas Espaciais - Institute for Space Research) for generating photographic or digital images will then allow the generation of geocoded artificial images with the same characteristics of a Thematic Mapper scene. The gray levels associated with each geocoded image pixel will represent not the terrain radiometry, but the corresponding auxiliary data. Author

Concurrent visible and infrared cloud imagery from four satellite sensors (DMSP OLS, NOAA AVHRR, GOES VISSR, LANDSAT MSS) have been intercompared. Inherent differences in cloud field analyses are noted due to sensor characteristics such as spatial and spectral resolution and scene/sensor geometry. Digital data were manipulated to simulate one sensor's data from that of another. Recommendations for further analysis of the collected data sets are provided. GRA

REMOTE SENSING TO DETECT ECOLOGICAL IMPACTS ASSOCIATED WITH ACID DEPOSITION Final Report
P. VanVoris and G. E. Wukelic May 1986 67 p
(Contract DE-AC06-76RL-01830)
(DE86-011649; EPRI-EA-4607) Avail: NTIS HC A04/MF A01

A planning study was conducted to determine the potential applications of remote sensing for detecting ecological impacts that have been reportedly caused by acid deposition. The project was divided into two phases: a technology assessment phase (Phase I) and a prototype demonstration (Phase II). The emphasis of the project was on detecting ecological change, not on determining the cause of that change. The latter is the role of ground-based research. Phase I consisted of an assessment of terrestrial and aquatic components that are indicative of sensitivity to acid deposition. The assessment identified remote sensing as the optimal cost-effective method for measuring the rate of change of land use, crop type, and forest canopy health over large geographic areas. In Phase II, spectral reflectance in the near-infrared region of the spectrum from forest canopies of Camel's Hump State Forest from two Landsat scenes from the summers of 1976 and 1983 were compared. Significant increases in spectral reflectance from the forest were detected when the pixels were compared, and it is hypothesized that this increase is indicative of a decline in forest growth and canopy closure. However, because of project limitations, no ground-truth data were collected by Battelle-Northwest scientists to verify the findings of the remote sensing analyses. A comprehensive research program is recommended to further investigate the use of remote sensing to detect ecological damage and its relationship to possible causative agents. Future research should also focus on the use of remote sensing for identifying ecosystems that may be sensitive to perturbations like acid deposition and improving our ability to model ecological processes. Priority should be given to detecting, monitoring, and modeling changes in forested watersheds. DOE

COMPARISON OF TROPICAL FOREST SURVEYS
J. Molofsky, C. A.S. Hall (Cornell Univ., Ithaca, N.Y.), and N. Myers Jun. 1986 70 p Prepared in cooperation with Cornell Univ., Ithaca, NY.; Myers (Norman), Oxford (UK).
(Contract DE-AC05-84OR-21400)
(DE86-011699; DOE/NBB-0078) Avail: NTIS HC A04/MF A01

This report examines the two most recent studies of tropical forest areas and rates of forest loss: Norman Myers' conversion of Tropical Moist Forests (1980), and the FAO/UNEP Tropical Forest Resources Assessment Project in order to identify and clarify discrepancies between them. The apparent discrepancy between their respective estimates of deforestation rates has been the basis of a continuing controversy. Myers' report was concerned principally with the conversion of virgin forests to other land use and the resulting extinction of tropical species. The FAO/UNEP report emphasized the availability of forest resources to meet the future fuelwood, housing, and economic needs of UN member states. The present paper attempts to identify more precisely the differences between the two studies in order to integrate the large tropical forest data base from these two sources into a cohesive whole. Specifically, we identify those countries covered in both surveys where the largest differences occur. The study was not designed to assess all discrepancies between Myers and FAO but only the discrepancies for those countries where both investigators have given specific numbers. DOE

STUDY OF SATELLITE SYSTEMS TO MONITOR EARTH'S RADIATION BUDGET Final Report
E. OMongain, S. Daultry, and J. G. Campbell Paris ESA Jan. 1986 158 p
(Contract ESA-5716/83-NL-MS)
(CAP-420-071; ESA-CR(P)-2230; ETN-86-98111) Avail: NTIS HC A08/MF A01

The problems of designing a system to simulate the end-to-end process of satellite based Earth Radiation Budget (ERB) measurements were investigated. Such a system would be used to simulate and determine the accuracy achievable in ERB studies with different orbit and instrument scenarios. A practical system to simulate the process is outlined. Effective modeling of error sources, in the measurement and inversion process, is important. Key elements of the system are an Earth radiation model, a measurement system model, and a data processing model; this latter element includes the simulation of calibration and inversion processes. A STUDY OF ENERGY CONVERSION DEVICES USING PHOTOACTIVE ORGANOMETALLIC ELECTROCATALYSTS Final Report, Feb. 1982 - Jun. 1985
John F. Evans and Kent R. Mann 23 May 1986 32 p
(Contract DAAG29-82-K-0063)
(AD-A169096; ARO-18767.9-CH) Avail: NTIS HC A03/MF A01 CSCL 10/2

The purpose of this project was to examine the feasibility of the use of transition metal hexakis arylisocyanide complexes confined to polymeric thin films in solar energy conversion systems. The chemical systems of interest were chromium, molybdenum and tungsten arylisocyanide complexes which had been previously examined in terms of their solution spectroscopy and photochemistry and had been found to have rather long excited state lifetimes. Since we had shown that charge transfer complexes in thin polymer films supported on electrode surfaces were viable routes to solar energy conversion composites, we chose to extend our studies to include these more promising complexes. The goals of the project then became threefold: 1) examine the thermodynamics and kinetics of charge transfer in the systems in which we had shown feasibility (polymeric ferrocenes) so as to understand the physical phenomena which were liable to control the overall efficiency and turnover numbers for the polymer bound photoelectrocatalysts, 2) further characterize the electrochemistry and physical inorganic chemistry of the more promising Cr, Mo and W hexakis arylisocyanide photoelectrocatalysts, and 3) examine ways by which these MLCT complexes could be entrapped in various polymer matrices. STATUS AND FUTURE OF GOVERNMENT-SUPPORTED AMORPHOUS SILICON RESEARCH IN THE US
W. L. Wallace and E. S. Sabisky Jun. 1986 6 p Presented at the 2nd International Photovoltaic Science and Engineering Conference, Beijing, China, 1 Aug. 1986
(Contract DE-AC02-83CH-10093)
(DE86-010702; SERI/TP-211-2960; CONF-860874-2) Avail: NTIS HC A02/MF A01

The Amorphous Silicon Research Project (ASRP) was estab-

lished at the Solar Energy Research Institute in 1983 and is responsible for all US Department of Energy government supported research activities in the field of amorphous silicon photovoltaics. The objectives and research directions of the project have been established by a Five-Year Research Plan, which was developed at SERI in cooperation with the Department of Energy in 1984 and is divided into research on single-junction and multi-junction solar cells. DOE/SERI has recently initiated a new three year program to be performed in collaboration with US industry to perform work on high efficiency amorphous silicon solar cells and submodules. The objectives of this initiative are: (1) to achieve 18% efficiencies for small area multi-junction amorphous silicon cells, and (2) to achieve amorphous silicon submodule efficiencies in the 10 to 13% range for single-junction and multi-junction submodule configurations over areas of at least 1000 cm².

DEVELOPMENT OF REGENERABLE ENERGY STORAGE FOR SPACE MULTIMEGAWATT APPLICATIONS
M. Olszewski 1986 5 p Presented at the Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25 Aug., 1986
(Contract DE-AC05-84OR-21400)
(DE86-011070; CONF-860810-9) Avail: NTIS HC A02/MF A01

A program has recently been initiated as a part of the national Strategic Defense Initiative (SDI) to develop energy storage echnology for space power applications. This program is jointly conducted by the Department of Energy and the Department of Defense. It is focused on the development of advanced technolo-gies in regenerable energy storage that will be required for generation f multimegawatt levels of sprint power for SDI space missions. Energy storage technology considered in the program relate to evices that have a high specific capacity for energy storage, which can provide high levels of electric power on demand, and which may be recharged with electric power. The devices of rincipal interest are electrochemical batteries, chemical fuel cells, nd electromechanical flywheels (the latter includes the motors nd generators used to provide the electrical to mechanical oupling). The intent of the program is to resolve technical feasibility sues associated with an electrically regenerable energy storage ystem satisfying SDI needs. Specifically, energy storage technolo- will be developed through the proof-of-concept stage within e next six years that provides a specific power greater than 5 kW/kg with an energy storage density of at least 450 kJ/kg.

E86-011235; LA-UR-86-1840; CONF-860810-5) Avail: NTIS A02/MF A01

Light-weight heat pipe wall elements that incorporate a thermal rage subassembly within the vapor space are being developed part of the Organic Rankine Cycle Solar Dynamic Power Systems IC-SDPS) receiver for the space station application. The rating temperature of heat pipe elements is in the 770 to °K range with a design power throughput of 4.8 kW per pipe. total heat pipe length is 1.9 M. The Rankine cycle boiler t transfer surfaces are positioned within the heat pipe vapor ce, providing a relatively constant temperature input to the orizer. The heat pipe design employs axial arteries and ibution wicked thermal storage units with potassium as the ding fluid. Stainless steel is used as the containment tube and en material. Performance predictions for this configuration have n conducted and the design characterized as a function of y geometry, distribution wick thickness, porosity, pore size, and permeability. Details of the analysis and of fabrication and assembly procedures are presented.

DUAL TEMPERATURE THERMAL STORAGE WITH COMPLEX COMPOUNDS
U. Rockenfeller and J. F. Martin (Oak Ridge National Lab., Tenn.) 1986 6 p Presented at the Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25 Aug., 1986 Prepared in cooperation with Oak Ridge National Lab., TN.
(Contract DE-AC05-84OR-21400)
(DE86-011511; CONF-860810-11) Avail: NTIS HC A02/MF A01

Storage of thermal energy through the formation or dissociation of complex compounds is described. A solid-vapor reaction of an absorbant, a metal inorganic salt, and an absorbate, the ligand of the complex provides energy storage for a heat pump cycle. One system is capable of dual temperature storage; that is, storage of cool for air conditioning and storage of heat for heating. Laboratory experiments which define the material and reaction characteristics of a sodium bromide/ammonia system were performed. The reaction rates, storage density and other operating parameters are described in functional form. The performance of a heat pump storage system is projected from these experimentally determined properties. The resulting system compares favorably with existing cool storage systems and with proposed heat or cool storage systems.

PROOF OF FEASIBILITY OF A NOVEL INVERTER FOR PHOTOVOLTAIC POWER CONDITIONING
A. Dickerson Apr. 1986 78 p
(Contract DE-AC04-76DP-00789)
(DE86-012729; SAND-86-7031) Avail: NTIS HC A05/MF A01

The Dickerson inverter concept obtains a sinewave current from an array that is segmented into a number of subarrays. These subarrays are switched among the ac phases so that the current from a given subarray is continuous and each phase is connected at all times to one or more subarrays. The control scheme assures a unity power factor current with real-time adjustment to power-system disturbances. A proof-of-concept inverter has been operated into a three-phase power system, with the dc supplied from a motor-generator set plus regulators that closely simulated the current-voltage characteristics of a photovoltaic array. The performance for the inverter has been projected for a 480V, three-phase system at the 50 kVA level. Computer simulations showed 98% utilization of array power was possible with efficiency better than 98% and harmonic content of 18% without filtering. An analysis of filtering costs indicates that reduction to 5% can be achieved at under $0.003 per watt for typical central-station applications. A more complex configuration was also analyzed with results of 99% utilization, 8% harmonic content, and the same efficiency. The intended power range for these inverters is 50 to 250 kVA per unit. The cost to produce the inverter at the 50 kVA level in quantities of 1000 units is estimated to be $0.05 per watt.

The major obstacle to developing a high-efficiency CdTe/CdS cell has been the lack of reproducibility. A number of process modifications have been made to overcome this. Some progress was made with a cell in which the CdTe is deposited onto a transparent ohmic contact; however, difficulties continued to be encountered in controlling the CdTe conductivity. Effort has been redirected to a cell in which the CdTe is deposited onto the CdS, leaving an exposed CdTe surface to which ohmic contact can be made. Research on the CuInSe/CdS cell has established that high efficiency can be achieved over a broad CuInSe composition range and a wide substrate temperature range. DOE

Prepared in cooperation with Sandia National Labs.
(Contract DE-AC04-76DP-00789)
(DE86-011762; SAND-86-7028) Avail: NTIS HC A06/MF A01

The high temperature catalytic dissociation of sulfur trioxide and the synthesis of its products in a closed-loop system presents an attractive prospect for converting, transporting and recovering solar energy. A laboratory scale, closed-loop, sulfur-oxide based experimental system was assembled and operated on the NMSU campus to demonstrate technical feasibility and to study the engineering problems associated with this chemical cycle. The system, which operated at a nominal 500 watts of energy conversion, contained most of the elements of a large scale power plant. Twelve separate experiments were performed with the system in a study of system stability during start-up and shut-down procedures and dissociator temperature variations. Descriptions of the laboratory closed-loop and the chemical reactors are given along with the experimental procedure, conditions, and results for each of the tests. Extensive discussion is given on the solar implications that the results from these experiments may have, and recommendations are made for follow-on experiments that may assist in resolving potential problems for thermochemical transport in a solar-powered plant. STEFAN-TYPE PROBLEM WITH VOID FORMATION AND ITS EXPLICIT SOLUTION
A. D. Solomon and D. G. Wilson Jun. 1986 26 p
(Contract DE-AC05-84OR-21400)
(DE86-013521; ORNL-6277) Avail: NTIS HC A03/MF A01

The density of most materials changes under melting and freezing. For certain materials being considered as potential latent heat storage materials for use in a space station, this density change may be large. A density change induces a change of volume of the material occupying a given container and this creates vapor bubbles or voids. We have formulated a problem that models a phase change process with such a void and that has an explicit solution. We examine the solution to gain a further understanding of the thermal and phase change performance of a material in which such voids form. We also look at the related problem of melting a material in which a void is initially present. Examples are given of the performance of a lithium fluoride phase change material subject to melting and freezing. DOE

A PARTITION OF SENSIBLE AND LATENT HEAT FLUXES ABOVE THE TERRA FIRMA AREA IN THE AMAZON FOREST [UMA PARTICAO DE FLUXOS DE CALOR SENSIVEL E DE CALOR LATENTE ACIMA DA FLORESTA AMAZONICA DE TERRA FIRME]
Leonardo DeanedeAbreuSa, Antonio Ocimar Mansi, and Yelisetty Viswanadham Jul. 1986 27 p In PORTUGUESE; ENGLISH summary Presented at a Workshop on GTE/ABLE-2A at INPE, 3-7 Feb. 1986
(INPE-3949-PRE/970) Avail: NTIS HC A03/MF A01

The partition of net radiation to sensible and latent fluxes above the Amazonian forest is studied. The Bowen ratio daily variability is discussed and its values are compared when calculated by different methods and distinct height above canopy. The variation of potential temperature gradient above forest canopy as a function of net radiation is also studied. Small values of potential temperature gradients and large values of net radiation obtained during daytime indicate that there was a strong convective activity in the Amazonian region. These results agreed very well with other forest observational results. The data utilized were collected from 21 to 24, August, 1984, related to the third field campaign of the Micrometeorological Experiment in the Amazon Basin. Author

EVALUATING ECOSYSTEM RESPONSE TO TOXICANT STRESS: A STATE SPACE APPROACH
A. R. Johnson 1986 30 p Presented at the 10th Symposium on Aquatic Toxicology and Hazard Assessment, New Orleans, La., 4 May, 1986

(Contract DE-AC05-84OR-21400)
(DE86-011777; CONF-8605137-3) Avail: NTIS HC A03/MF A01

Ecosystems can be regarded as complex biogeochemical systems maintained in a state of thermodynamic nonequilibrium by the flow of materials and energy. The state of such a system at any given time is generally assumed to be characterized by a finite set of variables. If these variables are taken to be the components of a vector, the instantaneous state of an ecosystem can be represented by a single point in an abstract multidimensional space. As an ecosystem undergoes changes in state, changes in the position of the corresponding vector will result, tracing out a state trajectory over time. Within the state space approach formulated above, the response of an ecosystem to a perturbation, such as the introduction of a toxicant, can be viewed as a displacement of the state vector away from its unperturbed trajectory. Such an approach was used to analyze data from a study of the response of experimental ponds and microcosms to chronic additions of a coal-derived synthetic oil. Ecosystem-level response surfaces and dose-response curves were derived based on the average separation (distance of displacement) of exposed ecosystems relative to controls. The results exhibited patterns analogous to those observed in classical toxicology based on organismal response, and could be used to define acceptable exposure conditions. The state space approach described here provides a coherent and objective framework for summarizing a large multivariate data set, and it should be of general use in providing both qualitative and quantitative descriptions of the behavior of perturbed ecosystems. SOUTHERN CALIFORNIA AIR QUALITY STUDY (SCAQS) SUGGESTED PROGRAM PLAN Final Report
D. Blumenthal, J. Watson, and D. Lawson Jun. 1986 187 p
(Contract ARB-A4-114-32)
(PB86-223427; ARB-R-86/278) Avail: NTIS HC A09/MF A01 CSCL 04A

The program plan outlines a suggested measurement and management approach and reviews the technical background for the Southern California Air Quality Study(SCAQS). SCAQS will be a multi-year, integrated, cooperative study which will be funded by government agencies, industry groups, and individual corporate sponsors. The goal of SCAQS is to develop a comprehensive air quality and meteorological data base for the South Coast Air Basin that can be used to test, evaluate, and improve elements of air quality simulation models for oxidants, PM-10, fine particles, toxic air contaminants, and acidic species. In addition, SCAQS will address specific technical questions regarding the emission, transport, transformation, and deposition of pollutants. The study is planned to take place in 1987 during six weeks in early summer and four weeks in late fall. Extensive routine air quality, aerosol, and meteorological measurements and additional special studies will take place on about 19 days during the study. GRA

ATMOSPHERIC TIDES MIDDLE ATMOSPHERE PROGRAM (ATMAP): REPORT OF THE WORKSHOP, KYOTO, JAPAN, DECEMBER 5-6, 1984

Jeffrey M. Forbes, ed., T. Aso, S. Avery, S. Bowhill, L. Coy, J. Forbes, G. Fraser, S. Fukao, S. Kato, D. Kurshner et al *In its* Middle Atmosphere Program. Handbook for Map, volume 21 Jul. 1986 p 12-55 (For primary document see N87-13015 04-46)

Avail: SCOSTEP Secretariat, Illinois Univ., 1406 West Green Street, Urbana, Ill. 61801 CSCL 04A

Experimentalists, data analysts, and theoreticians were brought together to study and interpret the results of four solstice campaigns conducted prior to the symposium. Emphasis was placed on campaigns III and V. Topics discussed included: review of the data and evaluation of the consistency with available theoretical models; interpretation of the data; recommendations on how the Atmospheric Tides Middle Atmosphere Program (ATMAP) results should reach the open literature such that the advancement of middle atmosphere science and the proprietary rights of the individual experimenters are best served; and recommendations concerning future campaigns and the future emphasis of ATMAP.

STRATOSPHERIC BALLOON EXPERIMENTS Final Report

U. B. Jayanthi, J. Brega, C. D. Pritsopoulo, F. S. Blanco, and R. V. Correa Sep. 1986 35 p

(INPE-3995-RPE/519) Avail: NTIS HC A03/MF A01

Three stratospheric balloon-borne experiments were conducted at the Tenente Rodolfo Marsh and Comandante Ferraz Stations in the Antarctic region to study the x-ray and gamma ray atmospheric background. The first experiment was flown in January 1984 to measure gamma ray flux and spectrum in the 0.2 to 4.8 MeV range at different altitudes. Experiments more sophisticated with similar objectives for x-rays (28.5 to 185 KeV) and for gamma rays (0.2 to 4.8 KeV) and for gamma rays (0.2 to 4.8 MeV) were conducted in two balloon flights in Jan/Feb. 1985 at Cmte. Ferraz base. The altitude spectral data is required to construct source functions at these latitude ranges. It was also desireable to use ceiling float data for the detection of enhanced line emissions and charge particle precipitation events. The gamma ray experiment provided ground radioactivity obtaining at the Cmte. Ferraz base and gamma ray spectra at lower stratospheric altitudes. The x-ray data near ceiling altitudes have been utilized to evaluate atmospheric build-up effects.

DEVELOPMENT OF A SENSITIVE SUPERCONDUCTING GRAVITY GRADIOMETER FOR GEOLOGICAL AND NAVIGATIONAL APPLICATIONS Final Report, Jul. 1980 - Jul. 1985

H. J. Paik and J.-P. Richard Washington NASA Sep. 1986 217 p

(Contract NAS8-33822)

(NASA-CR-4011; NAS 1.26:4011) Avail: NTIS HC A10/MF A01 CSCL 08G

A sensitive and stable gravity gradiometer would provide high resolution gravity measurements from space. The instrument could also provide precision tests of fundamental laws of physics and be applied to inertial guidance systems of the future. This report describes research on the superconducting gravity gradiometer program at the University of Maryland from July 1980 to July 1985. The report describes the theoretical and experimental work on a prototype superconducting gravity gradiometer. The design of an advanced three-axis superconducting gravity gradiometer is also discussed.

DESCRIPTION OF DATA ON THE NIMBUS 7 LIMS MAP ARCHIVE TAPE: OZONE AND NITRIC ACID

Ellis E. Remsberg, Robert J. Kurzeja, Kenneth V. Haggard, James M. Russell, III, and Larry L. Gordley Dec. 1986 73 p

(NASA-TP-2625; L-16136; NAS 1.60:2625) Avail: NTIS HC A04/MF A01 CSCL 04A

The Nimbus 7 Limb Infrared Monitor of the Stratosphere (LIMS) data set has been processed into a Fourier coefficient representation with a Kalman filter algorithm applied to profile data at individual latitudes and pressure levels. The algorithm produces synoptic data at noon Greenwich Mean Time (GMT) from the asynoptic orbital profiles. This form of the data set is easy to use and is appropriate for time series analysis and further data manipulation and display. Ozone and nitric acid results are grouped together in this report because the LIMS vertical field of views (FOV's) and analysis characteristics for these species are similar. A comparison of the orbital input data with mixing ratios derived from Kalman filter coefficients indicates errors in mixing ratio of generally less than 5 percent, with 15 percent being a maximum error. The high quality of the mapped data was indicated by coherence of both the phases and the amplitudes of waves with latitude and pressure. Examples of the mapped fields are presented, and details are given concerning the importance of diurnal variations, the removal of polar stratospheric cloud signatures, and the interpretation of bias effects in the data near the tops of profiles.

MIDDLE ATMOSPHERE MODELING Final Report
Darrell F. Strobel Jun. 1985 23 p
(Grant NAG5-489)
(NASA-CR-179934; NAS 1.26:179934) Avail: NTIS HC A02/MF A01 CSCL 04A

Breaking gravity waves generate and maintain a background level of turbulence which is capable of producing substantial cooling and/or heating in the upper mesosphere and lower thermosphere. The net thermodynamic effect of breaking gravity waves is critically dependent on the eddy Prandt number (P sub t) applicable to mesospheric turbulence. When P sub t is approximately 1, the calculations of the heat budget for the mesopause region imply that the globally averaged eddy or turbulent diffusion coefficient cannot exceed .000001 sq cm/s. This upper limit on turbulant diffusion applies to both potential temperature transport and chemically inert tracer transport when radiative damping is neglible. For chemically active species larger diffusion coefficients are permitted, because the effective eddy diffusion coefficient is increased by an additive term L/2 gamma (sup 2), where L is the chemical loss rate and gamma is the vertical wavenumber. For P sub t is approximately 4 to 6, the turbulent diffusion of momentum (D sub M) is sufficiently greater than the turbulent diffusion of heat (D sub H) that the conversion of gravity wave energy to heat with high efficiency nearly balances the divergence of the downward eddy heat flux in the wave breaking zone. Therefore the heat budget of the mesopause region would no longer provide a powerful and useful constraint on D sub H. If P sub t exceeds 6 with high efficiency for energy conversion to heat, gravity waves would heat the mesosphere throughout the wave breaking region. Author

SAGE 2 SATELLITE DATA SET VALIDATION Final Report
Geoffrey S. Kent and Pi-Huan Wang Nov. 1986 131 p
(Contract NAS1-17959)
(NASA-CR-178189; NAS 1.26:178189; STC-TR-2108) Avail: NTIS HC A07/MF A01 CSCL 04A

The results of a validation study of data obtained by the Stratospheric Aerosol and Gas Experiment 2 satellite experiment (SAGE 2) are given. Preliminary SAGE 2 data have been available for the period October, 1984 to May, 1985. In addition, the results of two correlative experimental measurement series have been studied in detail, as well as climatological data obtained by other techniques, including ground-based and airborne lidar. The study shows the SAGE 2 data to be of great potential value to studies of the microphysics of stratospheric aerosols, the chemistry of trace gases and stratospheric dynamics. A small number of unidentified errors in the current preliminary data set are described. These will be removed from the next version of the data set which is anticipated to be of archival quality. A SEMI-EMPIRICAL LOW-LATITUDE IONOSPHERIC MODEL Environmental Research Papers
David N. Anderson, Michael Mendillo, and Bruce Herniter 10 Oct. 1985 108 p
(AD-A168899; AFGL-TR-85-0254; AFGL-ERP-933) Avail: NTIS HC A06/MF A01 CSCL 04/1

Since current empirical models specifying low-latitude electron density profiles severely underestimate the daytime plasma density scale-height and total electron content (TEC), a Semi-empirical, Low-latitude, Ionospheric Model (SLIM) was developed which is not only more realistic but is also computationally fast. Electron density profiles (180 to 1800 km) are theoretically calculated as a function of latitude (every 2 deg between 24 N and 24 S dip latitude) and local time (every half-hour over 24 hours LT) by solving the time-dependent plasma continuity equation. Assuming a Chapman-like profile, sets of coefficients are then generated which reproduce these individual profiles. The coefficients themselves are easily stored, quickly retrieved and form the basis for a fast, portable, semi-empirical computer code. This report describes briefly the input parameters used to theoretically calculate profiles and the procedures used to generate the coefficients. The SLIM profiles are compared with the Chiu and Bent empirical models for Equinox, solar maximum conditions. Finally electron densities, the coefficients, TEC and 6300 A airglow intensities are listed in tabular form for three seasons (Equinox, June solstice, and December solstice) and two solar cycle periods (solar maximum and solar minimum). THEORETICAL STUDY ON THE CORRELATION BETWEEN WIDEBAND ELECTROMAGNETIC SPECTRA AND GEOLOGICAL STRUCTURES Final Report, 1 Sep. 1983 - 28 Feb. 1986
I. J. Won Apr. 1986 56 p
(Contract DAAG29-83-K-0152)
(AD-A168971; ARO-20065.2-GS) Avail: NTIS HC A04/MF A01 CSCL 08/7

A theoretical study has been performed to establish a mathematical means to compute the electromagnetic response of an earth having continuous and arbitrary conductivity variations, and to formulate a transfer function that can convert a wideband frequency-domain response to a continuous conductivity-depth function. The study was based upon past experiences in both theoretical and experimental aspects of frequency-domain electromagnetic method. A new formal integral representation was formulated for Maxwell's equations for a medium having an arbitrary conductivity function. It was shown that the representation is suitable for forward problems and, through a proper integral transform, the inverse may possibly exist. An attempt is being made to derive a transfer conductivity-depth profile. Author (GRA)

(AD-A169010; AFGL-TR-86-0034) Avail: NTIS HC A05/MF A01 CSCL 04/1

The reported research focused primarily upon plasma processes in and near the plasma cusp. The following areas were studied: plasma injection and transport in the mid-altitude polar cusp; observations of counterstreaming electrons at high altitudes; observations of upward electron beams and their relationship to region 1 Birkeland currents; observations of the electron population responsible for the 6300A SAR arc emission, polar rain observations; polar wind observations; and observations of ion and electron acceleration events produced by parallel electric fields. The primary observing platform for the research reported here was Dynamic Explorer 1 (DE-1). The DE-1 High Altitude Plasma Instrument (HAPI) consists of five electrostatic analyzers mounted in a fan-shaped angular array at angles of 45, 78, 90, 102, and 135 deg. with respect to the spacecraft spin axis. Each analyzer makes differential measurements of electrons and positive ions over an energy/charge range of 5 eV/e to 32 keV/e. Energy stepping proceeds at commandable rates of up to 64 sec, providing three-dimensional plasma distribution functions at the six second spin rate or DE-1. GRA

THE CURRENT-VOLTAGE RELATIONSHIP IN AURORAL CURRENT SHEETS Progress Report, 1986
D. R. Weimer, D. A. Gurnett, C. K. Goertz, J. D. Menietti, and J. L. Burch Mar. 1986 38 p
(Contract N00014-85-K-0404)
(AD-A169074; U-OF-IOWA-86-21) Avail: NTIS HC A03/MF A01 CSCL 04/1

The current-voltage relation within narrow auroral current sheets is examined through the use of high-resolution data from the high altitude Dynamics Explorer 1 satellite. The north-south per-

pendicular electric field and the east-west magnetic field are shown for three cases in which there are large amplitude, oppositely directed paired electric fields and narrow current sheets. These data are shown to indicate that there is a linear Ohm's law relationship between the current density and the parallel potential drop within the narrow current sheets. This linear relationship had previously been verified for large-scale auroral formations greater than 20 km wide at the ionosphere. The evidence shown here extends our knowledge down to the scale size of discrete auroral arcs.

Lg WAVE EXCITATION AND PROPAGATION IN PRESENCE OF ONE-, TWO-, AND THREE-DIMENSIONAL HETEROGENEITIES Scientific Report, 1 Oct. 1985 - 31 Mar. 1986
R. B. Herrmann 1 Feb. 1986 26 p
(Contract F19628-85-K-0029)
(AD-A169325; AFGL-TR-86-0026; SR-2) Avail: NTIS HC A03/MF A01 CSCL 08/11

A detailed study of Lg wave excitation and propagation from a sequence of earthquakes in New Brunswick is performed. Primary conclusions are that Lg Q increases with frequency. Perhaps more importantly for regional source studies is the observation of significant high frequency Pn and Sn arrivals at 1000 km which are much greater than the Lg arrival. Source estimates based on the Lg provide reasonable estimates of seismic moment, but corner frequencies differ from short distance measurements.

COORDINATED RADAR AND SATELLITE STUDIES OF IONOSPHERIC CURRENTS IN THE AURORAL ZONE AND POLAR CAP Final Report, 1 Sep. 1982 - 31 Dec. 1985
Roland T. Tsunoda, Anne Q. Smith, John D. Kelly, and Robert M. Robinson Dec. 1985 39 p
(Contract F19628-82-K-0045)
(AD-A169466; AFGL-TR-86-0022) Avail: NTIS HC A03/MF A01 CSCL 04/1

The objective is to provide real time surveillance of short term predictions in the electrodynamic state of the ionosphere and magnetosphere. The desired approach is to obtain all necessary environmental information by remote sensing or by in situ sampling from satellites; the parameters include electric fields, field-aligned currents, and ionospheric conductivities. Recently, a DMSP (Defense Meteorological Satellite Program) satellite has been launched (Flight 7) equipped with a triaxial fluxgate magnetometer. To qualify this type of instrument for participation in the above objective, an investigation was made of field aligned currents estimated from two different approaches: using magnetometer measurements made by the DMSP-F7 satellite and using ionospheric measurements made by the Sondrestrom incoherent scatter radar. Three events are analyzed when near simultaneous measurements were made by both instruments during satellite passes over the radar. Varying degrees of correlation were found in the derived field aligned currents. In all three cases, the gross features measured by the two methods were similar. The differences are discussed in terms of measurement error, analysis approximation, and geophysical uncertainties.

BALLOON-BORNE, HIGH ALTITUDE GRAVIMETRY: THE FLIGHT OF DUCKY 1a (11 OCTOBER 1983) Interim Scientific Report, Nov. 1982 - Dec. 1985
Andrew R. Lazarewicz, Brenda J. Schilinski, Ralph J. Cowie, Catherine L. Rice, Peter Moss, and Leonard N. Carter (Bedford Research Associates, Mass.) 31 Dec. 1985 86 p
(AF Proj. 7600)
(AD-A169942; AFGL-TR-85-0342; AFGL-ERP-943) Avail: NTIS HC A05/MF A01 CSCL 08/5

Gravity measurements from a high-altitude balloon were made in late September to verify global and upward-continued gravity models. The first flight was intended to provide balloon motion and environment data with a preliminary estimate of the quality of measured gravity values. A balloon operates in a dynamic, largely unpredictable environment; thus, the gravimeter senses accelerations due to balloon motions as well as gravitational acceleration. Independent measurements of balloon motions from an intertial navigation package (three accelerometers, three rate gyros, three-axis magnetometer and two tiltmeters) combined with ground tracking (X, Y and Z position and velocity) will allow for separation of balloon-induced accelerations from gravitational acceleration to 1 mGal, using tracking data to an accuracy of about 5 cm/sec in velocity for Eotvos corrections, and position to 1 m. This first engineering flight was planned to coincide with the lowest seasonal wind velocities over Holloman AFB, where AFGL has its permanent balloon launch facility. Mild wind velocities are desired to provide the most benign environment possible during the testing phase, and to keep the balloon within tracking range. The experiment design, launch, and flight operations, and a first look at the data are presented.

DEVELOPMENT OF ULTRASONIC MODELLING TECHNIQUES FOR THE STUDY OF SEISMIC WAVE SCATTERING DUE TO CRUSTAL INHOMOGENEITIES Final Report, 13 Apr. 1983 - 30 Sep. 1985
M. N. Toksoz, Anton M. Dainty, and Edmond E. Charrette, III Mar. 1986 86 p
(Contract F19628-83-K-0027)
(AD-A170017; AFGL-TR-86-0087) Avail: NTIS HC A05/MF A01 CSCL 08/11

Scattering of Rayleigh waves from surface features was investigated using three-dimensional ultrasonic models at frequencies near 1 MHz and two dimensional finite difference calculations. Models were constructed of aluminum blocks and an aluminum powder-epoxy composite of lower density and seismic velocity. The aluminum has similar seismic velocities and density to igneous and metamorphic rocks while the composite is similar to sedimentary materials. Kilometers in the earth are scaled to millimeters in the models which makes 1 MHz in the models equivalent to 1 Hz in the earth, typical of the frequencies observed in regional seismograms. Relief on the models which was a few millimeters, the order of a wavelength, was restricted to an isolated circular mesa of composite on a metal block and an isolated circular

depression both unfilled and filled with composite. Calculations were made for similar situations by the finite difference method; comparisons indicated a general similarity in the seismograms, allowing us to use the finite difference calculations to gain physical insight into the scattering process. Topography alone produces attenuation due to scattering into reflected surface waves and body waves. Adding low velocity composite to the model considerably changes this picture. GRA

MEASUREMENT OF ATMOSPHERIC EMISSION SPECTRA AT HIGH ALTITUDES Final Report, 8 Nov. 1982 - 8 Nov. 1985
F. H. Murcray, F. J. Murcray, D. G. Murcray, and A. Goldman 22 Nov. 1985 14 p
(Contract F19628-83-K-0006)
(AD-A170143; AFGL-TR-86-0061) Avail: NTIS HC A02/MF A01 CSCL 04/1

The objective of this contract has been to obtain high spectral resolution atmospheric emission data at altitudes up to 40 km. In order to accomplish this cryogenically cooled moving mirror Michelson interferometer system was constructed that is capable of operating independently while being carried aloft by a large balloon. Interpretation of the atmospheric emission spectra obtained under this contract requires a computer program that can calculate theoretical atmospheric emission spectra on a line by line basis. All such programs rely on an accurate list of line parameters of molecules of atmospheric interest. GRA

IMPROVING foF2 PREDICTION FOR THE SUNRISE TRANSITION PERIOD Final Report, Oct. 1984 - Sep. 1985
B. S. Dandekar and J. Buchau 29 Jan. 1986 65 p
(AD-A170457; AFGL-TR-86-0026; AFGL-ERP-946) Avail: NTIS HC A04/MF A01 CSCL 04/1

During the 2- to 3-hr sunrise transition period, the relative change in foF2 is 20 to 60 percent per hour and is independent of solar activity. The change is largest in winter and smallest in summer. To prevent the skip distance from changing by more than 250 km, that is, to maintain continuous illumination of at least 50 percent of the barrier (nominal width 500 km), requires that the operating frequency be changed for every 6 percent change in foF2. Thus, in the case of an OTH system, the operating frequency has to be adjusted during the sunrise period every 6 to 20 min (seasonal dependence) for satisfactory performance. To accommodate such rapid changes, an empirical algorithm has been tested for improved foF2 predictions during sunrise. The prediction scheme is based on the availability of relevant (under the oblique raypath) real time ionospheric data. GRA

AN ANALYSIS OF THE ACOUSTIC CHARACTERISTICS OF ABSS (ACOUSTIC BACKSCATTER SYSTEM) AND ITS DEPLOYMENTS Report, 1 Oct. 1982 - 31 Mar. 1986
Keith W. Bedford and Charles M. Libicki Jul. 1986 110 p
(Contract N00014-83-K-0003)
(AD-A170487) Avail: NTIS HC A06/MF A01 CSCL 17/1

The benthic boundary layer is the interface between the world ocean and the earth beneath. Extending from the top of the Ekman layer, where bottom drag begins to exert its influence on the general oceanic circulation, down to a few centimeters below the sediment surface, it is the site of exchange of momentum, heat, solutes and suspended load. To aid in investigating these zones the ABSS (Acoustic Backscatter System) a combination 5 MHz - 1 MHz system is deployed by the High Energy Benthic Boundary Layer Experiment (HEBBLE) team on the Nova Scotian Rise at a depth of 4800m. This device can, without entering the observed flow, sense suspended sediment simultaneously in over 100 1-cm range bins, as frequently as one hundred times per second, while the low frequency transducer of ABSS looks upward through the Ekman layer, using the same measurement principle, but in 20 cm range bins. Inasfar as their sampling density in space and time for turbulent fluid mechanical data, these devices are quite unprecedented. GRA

A SIMPLE SOLAR, SPECTRAL MODEL FOR STUDYING THE EFFECTS OF CLOUD COVER AND SURFACE ALBEDO ON THE INCOMING SOLAR RADIATION Ph.D. Thesis
Alfred M. Powell, Jr. 1986 131 p
(AD-A171284; AFIT/CI/NR-86-123D) Avail: NTIS HC A07/MF A01 CSCL 04/1

The effect of cloud cover and surface albedo on the solar insolation at the surface of the Earth was investigated. The model uses Bird's (1984) clear sky model for direct normal and diffuse horizontal irradiance as its basis. Bird's model was modified to include inclined surfaces and cloud cover. The clouds were modelled using parameterizations developed by Welch, Cox and Davis (1980) and a weighting technique to account for cloud shape using plane parallel calculations. The radiative transfer in the cloud was modelled by a two stream approximation known as the Shuster Schwarzchild method. The model results were compared with clear sky broadband and spectral observations, and cloudy broadband observations. The effects of cloud amount, cloud thickness, cloud type, and surface albedo are demonstrated. Cloud amount and cloud thickness are the predominant cloud factors affecting insolation. High surface albedos tend to slow the decrease in insolation due to increasing cloud cover; while low surface albedos cause greater variation in insolation under the same circumstances. GRA

N87-13039# Lawrence Livermore National Lab., Calif.
ATMOSPHERIC ILLUMINATION AND SHADOWS, REVISION 1
N. L. Max 15 Jan. 1986 8 p Presented at SIGGRAPH '86, Dallas, Tex., 18 Aug., 1986
(Contract W-7405-eng-48)
(DE86-010971; UCRL-93965-Rev-1; CONF-860875-1-Rev-1) Avail: NTIS HC A02/MF A01

The shadow volume algorithm of Frank Crow was reorganized to provide information on the regions of illuminated space in front of each visible surface. This information is used to calculate the extra intensity due to atmospheric scattering, so when the atmosphere is partly in shadow, columns of scattered light will be visible. For efficiency in sorting the shadow edges, the image is computed in polar coordinates. DOE

PARAMETERIZED NUMERICAL FIT TO TOTAL COLUMN OZONE CHANGES CALCULATED BY THE LLNL 1-D MODEL OF THE TROPOSPHERE AND STRATOSPHERE
P. S. Connell May 1986 24 p
(Contract W-7405-eng-48)
(DE86-011008; UCID-20762) Avail: NTIS HC A02/MF A01

In this note we present a numerical parameterization of the results of the LLNL one-dimensional model for total column ozone change in terms of surface emissions or abundances of the various source species. The LLNL model was used in an earlier study to evaluate a significant number of time-dependent scenarios of future trends in the emissions or atmospheric abundances of CFC-11, CFC-12, CFC-22, CFC-113, CCl, CHCCl, CO, CH, NO, Halon-1301 and Halon-1211. This parameterization produces calculated ozone changes within about 2% (column ozone change relative to the 1985 model atmosphere) of the actual complete model calculation for a wide range of scenarios and ozone changes. It therefore can approximately represent the actual 1-D model for the purposes of economic analysis of regulatory strategies. It is, however, crucial to note that the 1-D model results, and consequently this parameterization, are subject to substantial uncertainties. Future improvements in our knowledge of atmospheric photochemical kinetics and transport in the troposphere and stratosphere should be expected to modify these current results. DOE

CONVECTIVE SURFACE LAYERS: INFLUENCE OF THE BOUND-

ARY LAYER DEPTH Ph.D. Thesis
Kurt Tyler Loveland 1985 256 p
Avail: Univ. Microfilms Order No. DA8605423

Two methods, one semi-empirical and the other theoretical, are employed to develop a new theory for predicting the behavior of turbulence characteristics in convective surface layers. This theory is based on three length scales; the height above the ground, the Monin-Obukhov length, and the boundary layer depth (h). The chief advantages are its relative simplicity, its ability to predict the height dependence of the mean gradients and second moments in a manner consistent with their observed behavior in the atmosphere and in large-eddy simulations, and it is consistent with the theoretical requirements of free convection similarity. The semi-empirical method is based on nonlinear least squares fits to a generalized Businger-Dyer formulation with up to four unknown parameters. Using data obtained primarily from the Kansas and Minnesota field experiments, this method is applied to the universal functions for the wind and temperature gradients, the standard deviation of the horizontal wind velocity, the variances of vertical velocity and temperature, the streamwise heat flux, and the turbulence dissipation. Dissert. Abstr.

CHARACTERISTICS OF ATMOSPHERIC TURBULENCE NEAR THE GROUND. PART 3: VARIATIONS IN SPACE AND TIME FOR STRONG WINDS (NEUTRAL ATMOSPHERE)
Oct. 1986 39 p Supersedes ESDU-75001
(ESDU-86010-Pt-3; ISBN-0-85679-562-3; ISSN-0143-2702) Avail: ESDU

This Data Item ESDU 86010 is an addition to the Wind Engineering Sub-series. It is the third in a group providing comprehensive atmospheric turbulence characteristics, and deals with the relationship between values measured at two points in space of the three turbulence velocity components. It covers joint-probability, cross-correlations, coherence and phase angle (giving cross-spectral densities) and integral length scales of all turbulence components in any direction. The data apply throughout the atmospheric boundary layer and for different types of terrain. Since the length scales are all related to that for the along-wind component in the along-wind direction, effects of roughness changes on all of them can be accounted for through their effect on that length scale predicted using ESDU 85020. The data were derived from the von Karman equations modified to take acount of the distorting (anisotropic) effects near the ground. The theoretical basis allows rational extrapolation from measurements made at moderate wind speeds to much higher design speed case when, in particular, much longer length scales are obtained. ESDU

Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

An experimental study in a baroclinic annulus with heating and cooling on the upper and lower horizontal surfaces was completed. Four basic regimes of flow were observed: (1) axisymmetric flow, (2) cellular (deep) convection, (3) convective rolls (boundary layer), and (4) baroclinic instability. There was no symmetric (or nearly symmetric) baroclinic instability observed, although it was determined by numerical calculations that we transversed regions in parameter space where the symmetric instability was present. The non-symmetric baroclinic instability (Eady type) was observed instead. Although the vertical depth was rather small and hence viscous damping was strong, large-amplitude baroclinic waves were made possible by imposing a very weak static stability. Author

Meteorologists and astrophysicists interested in large scale planetary and solar circulations have come to recognize the importance of rotation and stratification in determining the character of these flows. In particular, the effect of latitude-dependent Coriolis force on nonlinear convection is thought to play a crucial role in such phenomena as differential rotation on the Sun, cloud band orientation on Jupiter, and the generation of magnetic fields in thermally driven dynamos. The continuous low-gravity environment of the orbiting space shuttle offers a unique opportunity to make laboratory studies of such large-scale thermally driven flows under the constraint imposed by rotation and sphericity. This is possible because polarization forces in a dielectric liquid, which are linearly dependent on fluid temperature, give rise to an effectively radial buoyancy force when a radial electrostatic field is imposed. The Geophysical Fluid Flow Cell (GFFC) is an implementation of this ideal in which fluid is contained between two rotating hemispheres that are differentially heated and stressed with a large a-c voltage. The experiment, to be flown on Spacelab III (currently set for launch April 29, 1985), will explore non-linear mode selection and high Rayleigh number turbulence in a rotating convecting spherical shell of liquid. Experiments will be carried out in a low driving parameter range where some limited numerical experimentation is currently feasible, as well as in a parameter range significantly beyond numerical computation for many years. THEORETICAL AND EXPERIMENTAL DESIGN STUDIES FOR THE ATMOSPHERIC GENERAL CIRCULATION EXPERIMENT c46

William W. Fowlis, David H. Hathaway, Timothy L. Miller, Glyn O. Roberts (Roberts Associates, Inc., Vienna, Va.), and Kenneth J. Kopa (Drake Univ., Des Moines, Iowa.) *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04A

The major criterion for the Atmospheric General Circulation Experiment (AGCE) design is that it be possible to realize strong baroclinic instability in the spherical configuration chosen. A configuration was selected in which a hemispherical shell of fluid is subjected to latitudinal temperature gradients on its spherical boundaries and the latitudinal boundaries are insulators. Work in the laboratory with a cylindrical version of this configuration revealed more instabilities than baroclinic instability. Since researchers fully expect these additional instabilities to appear in the spherical configuration also, they decided to continue the laboratory cylindrical annulus studies. Four flow regimes were identified: an axisymmetric Hadley circulation, boundary layer convection, baroclinic waves and deep thermal convection. Regime diagrams were prepared. Author

MULTISCALE MODELING TO EVALUATE PROPOSED SPACE-BASED DOPPLER LIDAR SAMPLING STRATEGIES

G. D. Emmitt *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A proposal has been made to place a pulsed Doppler lidar on a space platform (Huffaker, et al., 1980; Emmitt, 1982) in a low earth orbit (200 to 800 km) to measure the atmospheric winds with a spatial resolution commensurate with the current continental rawinsonde network density - i.e., 300 to 500 km resolution. In the case of the space-based doppler lidar, the full range of space scales applies. Single shot pulses with dimensions of 10 x 1000 meters are used to sample areas 100,000 x 100,000 meters to resolved mass flow structure with wavelength of 1 million meters. Simulation studies, therefore, require an equally broad range of atmospheric models. A general circulation model is appropriate to answer questions regarding the impact of a global wind measuring system upon synoptic forecasts. Since the nominal resolution of the spacebased system is expected to be a few 100's of kilometers, then a numerical model with mesoscale dynamics is required. The meaning of an average Doppler shift within a laser pulse volume must be evaluated with models of turbulent/convective scale motions and aerosol gradients. Examples of how models on all these scales have been applied in an ongoing simulation study are presented. In particular, the uncertainties in a mesoscale wind estimate are separated into those arising from pulse scale variances and those due to sample distribution within a prescribed resolution volume. Trade-offs between accuracy and representativeness are discussed in terms of the model results. Author

ESTIMATION OF PRECIPITATION FROM GOES IR IMAGERY DURING FGGE: APPLICATION TO DIAGNOSTIC STUDIES

Franklin R. Robertson *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 5 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The objectives were to (1) develop a method of estimating open-ocean rainfall and associated latent heat release via GOES IR satellite imagery; (2) to use remote precipitation estimates to investigate the role of diabatic forcing in the maintenance of the South Pacific Convergence Zone (SPCZ) during FGGE SOP-1/; and (3) to assess the significance of non-quasigeostrophic transports of energy in several cyclogenetic events preceding the development of a North Atlantic blocking episode during FGGE SOP-1. The bulk of the early FY-85 work was directed toward development of the single pixel indexing technique (SPI) which assigns a rain rate to GOES IR black-body temperatures, T sub b, via a non-linear statistical relationship developed with raingauge measurements. The method was tested against radar-derived rainfall during GATE raingauge measurements over coastal North Carolina and island stations in the South Pacific Ocean. Skill was found comparable to Arkin's method (1979 MWR) in convective situations. The results suggest that transferring a rain algorithm from one oceanic regime to another may not require substantial modification of coefficients or tunable parameters. Twelve H mean rainfall amounts were produced for the region bounded by 10 deg. N, 50 deg. S, 120 deg W and 170 deg. E during the period January 10 to 16, 1979. These estimates constitute a basic input to diagnostic calculations of diabatic heating over the SPCZ region. ECMWF level III-b data analyses was used to compute several components of the APE balance in the South Pacific during the period January 10 to 18, 1979. Author

THE USE OF SATELLITE DATA IN UNDERSTANDING AND PREDICTING CONVECTIVE AND LARGE-SCALE DYNAMICAL PROCESSES c46

John A. Dutton, John H. E. Clark, and Hampton N. Shirer *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04A

A two-layer truncated baroclinic spectral model was developed to study the long-term evolution of disturbances to a baroclinically unstable mean flow. Topography and crudely-parameterized radiative processes were accounted for. As a result of Robert Schlaak's discovery of the underlying barotropic nature of the index oscillation as well as reviewers suggestions about the original manuscript, the model has been revised to allow for barotropic as well as baroclinic wave-mean flow interactions. The form-drag exerted by the topography on the barotropic part of the mean flow is larger than on the baroclinic part and thus researchers anticipate significant changes from the original calculations on the index oscillation when it is strongly modulated by topography. Researchers believe that since the index oscillation accounts for a significant portion of atmospheric temporal variance, the long term predictability could be improved if reliable forecasts of the index oscillation were available. Two spectral models of the index oscillation, one barotropic and the other baroclinic, have been developed. The latter allows for moisture, radiation, land-sea temperature contrasts, and energy exchanges with the underlying surface.

VARIATION OBJECTIVE ANALYSES FOR CYCLONE STUDIES

Gary L. Achtemeier, Stanley Q. Kidder, and Harry T. Ochs *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 4 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

The objectives were to: (1) develop an objective analysis technique that will maximize the information content of data available from diverse sources, with particular emphasis on the incorporation of observations from satellites with those from more traditional immersion techniques; and (2) to develop a diagnosis of the state of the synoptic scale atmosphere on a much finer scale over a much broader region than is presently possible to permit studies of the interactions and energy transfers between global, synoptic and regional scale atmospheric processes. The variational objective analysis model consists of the two horizontal momentum equations, the hydrostatic equation, and the integrated continuity equation for a dry hydrostatic atmosphere. Preliminary tests of the model with the SESMAE I data set are underway for 12 GMT 10 April 1979. At this stage of purpose of the analysis is not the diagnosis of atmospheric structures but rather the validation of the model. Model runs for rawinsonde data and with the precision modulus weights set to force most of the adjustment of the wind field to the mass field have produced 90 to 95 percent reductions in the imbalance of the initial data after only 4-cycles through the Euler-Lagrange equations. Sensitivity tests for linear stability of the 11 Euler-Lagrange equations that make up the VASP Model 1 indicate that there will be a lower limit to the scales of motion that can be resolved by this method. Linear stability criteria are violated where there is large horizontal wind shear near the upper tropospheric jet.

UTILIZATION OF SATELLITE CLOUD INFORMATION TO DIAGNOSE THE ENERGY STATE AND TRANSFORMATIONS IN EXTRATROPICAL CYCLONES

Phillip J. Smith *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

An important component of the research was a continuing investigation of the impact of latent release on extratropical cyclone development. Previous efforts to accomplish this task have focused on the energy balance and the vertical motion field of an intense winter extratropical cyclone over the United States. During this fiscal year researchers turned their attention to a more fundamental diagnostic variable, the height tendency. Central to this effort is the use of a modified form of the quasi-geostrophic height tendency equation, in which geostrophic wind components have been replaced by observed winds and a latent heat release term has been added. This methodology was adopted to produce a simple diagnostic model which retains the essential mechanisms of quasi-geostrophic theory but more faithfully describes observed wave development when the Rossby Number approaches and exceeds 0.5. Results to date indicate that the new model yields height tendencies that are superior to those obtained from the quasi-geostrophic formulation and are sufficiently close to the observed tendencies to be a useful tool for diagnosing the principle large-scale forcing mechanisms in th e700-300 mb layer. Of the three forcing terms included in the new model, vortity advection is in general dominant. The most persistent challenge to this dominance is made by the thermal advection. On the whole, latent heat release plays a secondary role. Finally, during the rapid intensification observed for this cyclone, all three processes complement each other in forcing height falls.

DYNAMICS AND ENERGETICS OF THE SOUTH PACIFIC CONVERGENCE ZONE DURING FGGE SOP-1

Dayton G. Vincent *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

The major research objectives are to diagnose the physical processes responsible for the maintenance of the South Pacific Convergence Zone (SPCZ) and to examine the role of the SPCZ in the large-scale circulation patterns of the Southern Hemisphere. To accomplish these objectives researchers used several data sources which include: a modified set of Level III-b upper air analyses, originally produced by ECMWF (Vincent, 1982); subjectively analyzed surface analyses for the South Pacific based on island station reports (Vincent, 1985); outgoing longwave radiation values supplied to us by NOAA/NESDIS; and equivalent black body temperatures and precipitation rates derived by Robertson. In the past year researchers found that wave number four plays an inportant role in the Southern Hemisphere tropics during the 15-day period when the sPCZ was a dominant feature, particularly with regard to the baroclinic conversion of potential to kinetic energy (Huang and Vincent, 1985). The convectively-active SPCZ area was found to make a significant contribution to this conversion process; thus, it appears that baroclinic effects and latent heating are important in maintaining the SPCZ. Recently efforts concentrated on two research tasks, an examination of cyclone activity within the SPCZ (Kann, 1985; Vincent, 1985; Vincent and Kann, 1985; and a study of the heat and moisture budgets in the South Pacific (Miller, et al., 1985). It was found that cyclonic disturbances occurred with regularity in the Zone from 10 to 17 January.

APPLICATION OF SATELLITE DATA TO TROPIC/SUBTROPIC MOISTURE COUPLING

James P. McGuirk and Aylmer H. Thompson *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

The objective is to develop analysis tools for use of satellite data to interpret synoptic-scale systems in data-void regions. Interim goals are to: (1) quantify the synoptic information content of satellite data; and (2) utilize these data in the diagnosis of moisture bursts

in the eastern tropical Pacific Ocean. Researchers developed and implemented a statistical procedure for using TIROS N microwave data to infer infrared channel data for overcast conditions; they used the same procedure for deducing full TIROS N channel radiance profiles from NOAA 5 VTPR channel data over regions where the TIROS N data are missing. An empirical orthogonal function analysis of twice-daily channel radiance fields over the tropical eastern Pacific was completed. The vertically oriented eigenfunctions were interpreted in terms of typical meteorological events. The horizontal distribution of the eigenfunction amplitudes relates these meteorological signals to moisture bursts. A pair of moisture burst climatologies is complete: one of four years using infrared imagery (including the highly anomalous 1982 to 83 cold season); the other implementing 850 to 200 mb wind analyses in conjunction with GOES imagery. A number of different evaluations of the synoptic evolution of moisture fields (enhanced infrared imagery, moisture channel data, FGGE humidity analysis, and in situ station and sounding observations) are compared. All have limitations; all can be utilized together; all together are still less than adequate in the tropical Pacific. Author

OBSERVATIONAL AND THEORETICAL STUDIES OF THE EVOLVING STRUCTURE OF BAROCLINIC WAVES: ATTRACTOR DYNAMICS OF GLOBAL WEATHER SYSTEMS

Barry Saltzman, Anthony R. Hansen, Richard N. Nagle, and Chung-Muh Tang (Universities Space Research Association, Columbia, Md.) *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

Significant progress was made in developing a six-component dry model of mid-latitude baroclinic wave evolution, and a ten-component moist model. These models include representations of airflow over mountians and non-adiabatic processes. As a first step, the properties of a reduced, three component, baroclinic system are studied. The classical baroclinic stability criteria emerge as the properties of one of the three equilibria admitted, with the remaining two equilibria forming the attractor region for the observed weather activity. Passive tracer evolution in a baroclinic wave was studied. A model in which only constituents trapped within low atmospheric levels are considered, has been extended to include the possibility for fluxes into the upper levels of the atmosphere. The reported results for the lower levels achieved previously are shown to be qualitatively similar to those obtained by these new calculations in which the vertical flux constraint is removed. An extensive study of an 8-year record of global outgoing longwave radiation for the Northern Hemisphere reveals that blocking events exhibit only a weak signature of blocking highs, as measured by relatively low values of the ratio of the standard deviation to the mean value of the observed long wave outgoing radiation. Though present in many cases, the signature is not a strongly distinctive feature of the blocking episodes. Author

DEEP CONVECTION IN MESOSCALE CONVECTIVE SYSTEMS

Steven J. Goodman *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 1 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

A study was undertaken to examine the evolution of radar echoes and lightning attending the convective storms in mesoscale convective systems (MCS) and the relationships between the spatial and temporal evolution of deep convection and the storm environment, precipitation, severe weather, and lightning. The total number of ground discharges ranges from 10,000 to 30,000 over the life cycle of the MCS with peak sustained rates (for up to 10 consecutive hours) in excess of 2000 per hour. The peak lightning activity occurs from 5 to 20 hours after the first storms and anywhere from 7 hours prior to 7 hours after the time of the maximum areal extent of the MCS for very similar synoptic environments. Thus, it appears that mesoscale and sub-synoptic scale mechanisms are responsible for these large temporal variation in lightning activity. In addition, we have found that the lightning rates in MCS's are not related to either the size or the duration of the MCS. Preliminary results suggest that the MCA's with embedded squall lines produce the greatest flash rates. Author

STORM SEVERITY DETECTION (RF)

R. L. Johnson (Southwest Research Inst., San Antonio, Tex.) and S. J. Goodman *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

Atmospheric electrical emissions occurring in association with Hurricane Alicia were observed by two crossed baseline phase linear interferometers. The sensors were located in San Antonio, Texas, and at Marshall Space Flight Center (MSFC), Huntsville, Alabama. An analysis of the data has indicated that the direction finding (DF) performance of the San Antonio site was extremely good while the DF performance at the MSFC site evidenced erratic behavior. A check of the data acquisition hardware revealed an intermitted problem in one of the radio receiver channels. Since the system has experienced several lightning strikes during the early spring of 1984, it was necessary to ship the entire rack of equipment back to SwRI for refurbishment. Analysis of the DF data from the interferometer site at San Antonio is being done. A limited subset of the MSFC data acquired during Hurricane Alicia has been found to be valid. These were data which satisfied the phase linearity criteria. Approximately 2,000 location estimates have been produced on the valid data. The results of the DF analysis and the location data are being correlated with the McIDAS data base at Marshall Space Flight Center, and with the radar summary data provided by the Hurricane Research Division using the National weather Service radar Facility at Galveston, Texas. STUDIES OF LIGHTNING DATA IN CONJUNCTION WITH GEOSTATIONARY SATELLITE DATA

Brian Auvine and David Martin *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

Since January, work has been proceeding on the first phase of this project: the creation of an extensive real-time lightning data base accessible via the Space Science and Engineering

Center McIdas system. The purpose of this endeavor is two-fold: to enhance the availability and ease of access to lightning data among the various networks, governmental and research agencies; and to test the feasiblity and desirability of such efforts in succeeding years. The final steps in the creation of the necessary communications links, hardware, and software are in the process of being completed. Operations ground rules for access among the various users have been discussed and are being refined. While the research planned for the last year of the project will rely for the most part on archived, quality-controlled data from the various networks, the real-time data will provide a valuable first-look at potentially interesting case studies. For this purpose, tools are being developed on McIdas for display and analysis of the data as they become available. In conjunction with concurrent GOES real-time imagery, strike locations can be plotted, gridded and contoured, or displayed in various statistical formats including frequency distributions, histograms, and scatter plots. The user may also perform these functions in relation to arbitrarily defined areas on the satellite image. By mid-May these preparations for the access and analysis of real-time lightning data are expected to be complete. Author

LIGHTNING MAPPER AND THE FUTURE
Hugh J. Christian *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A trade-off analysis was completed that reveals how the lightning mapper detection efficiency will change as a function of interference filter bandwidth, pixel field of view, and telescope aperture. It is shown that the critical parameter on which we have minimum flexibility is filter band-width. The problem is that too narrow a filter bandwidth is incompatible with wide areal coverage. The trade-off analysis demonstrates that an 80 percent lightning detection efficiency will technically be relatively straight-forward, while a 90 percent detection efficiency will apparently be difficult to achieve. Three focal plane designs are currently under consideration. One would use a single large, solid state silicon integrating array with multiple output channels and off-the-focal-plane analog, time domain, background removing fibers. A second design would use the same technology, but the sensor would consist of up to four virtually independent focal plane arrays. This design reduces the areal coverage of each detector. Thus narrower interference filters could be utilized. Superior performance would be realized at a probable increase in cost. The final design would use a three-dimensional focal plane in order to perform background removal at the focal plane. Superior performance would be achieved along with reduced weight and power requirements. Unfortunately, this focal plane technology is still under development. Author

SPACE SHUTTLE/MESOSCALE LIGHTNING EXPERIMENT
Otha H. Vaughan, Jr., B. Vonnegut (State Univ. of New York, Binghamton.), and Marx Brook (New Mexico Inst. of Mining and Technology, Socorro.) *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 1 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A payload integration plan (PIP) is now being developed with Johnson Space Center integration personnel which covers management, structural thermal, electrical power/avionics, training, ground operations, safety requirements, etc., in support of this experiment. If a Shuttle flight can be identified, researchers hope to conduct the experiment in the late summer or fall of 1985. Some preliminary TV lightning data has been collected by Shuttle crews on 41D and 51D and researchers are doing an analysis of it. Additional flights will be conducted to obtain data on Mesoscale Lightning Observations. Researchers will continue to study how to improve the data collection using the onboard TV cameras. By more interaction with the crews who have used the TV camera to obtain TV of lightning, they are planning to optimize the crew time and have better TV camera operations management to produce more useful data. As the crews are better trained in the use of the gain control settings and/or camera iris operations, the quality of the TV data will be improved. Author

OPTICAL CHARACTERISTICS OF LIGHTNING AND THUNDERSTORM CURRENTS
E. Philip Krider (Arizona Univ., Tucson.) and Richard J. Blakeslee *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 1 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

Researchers determined that lightning can be used to determine the diurnal variations of thunderstorms, i.e., storms that produce audible thunder, and that these variations are also in good agreement with diurnal variations in rainfall and convective activity. Measurements of the Maxwell current density, J sub m, under active thunderstorms show that this physical quantity is quasi-steady between lightning discharges and that lightning does not produce large changes in J sub m. Maps of J sub m show contours of iso-current density that are consistent with the locations of radar echos and the locations of where lightning has altered the cloud charge distribution. Author

OPTICAL CHARACTERISTICS OF LIGHTNING
Steven J. Goodman *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A study of the optical characteristics of cloud-to-ground dischargers and how they compare with intracloud flashes was completed. Time resolved optical (7774A) and electric field-change waveforms were measured above clouds from a U2 airplane coincident with ground-based measurements of lightning. The optical pulse trains are studied for within and between flash variability. Specifically, for each flash researchers examine the 10, 50 (full width half maximum), and 90 percent pulse widths; the 10-10, 10-50, 10-90, and 10-peak percent amplitude rise times; the radiances (optical power densities); radiant energy densities; and pulse intervals. The optical pulse characteristics of first strokes, subsequent strokes, the intracloud components of cloud-to-ground flashes and intracloud flashes as viewed from above cloud are shown to exhibit very similar waveshapes, radiances and radiant energy densities. Descriptive statistics on these pulse categories were tabulated for 25 visually confirmed cloud-to-ground flashes (229 optical pulses) and 232 intracloud flashes (3126 optical pulses). A companion study of lightning observations above and below cloud in storms, storm complexes, and mesoscale convective systems has also been completed. Researchers compared the mapping of total lightning activity from above clouds with ground-based measurements and storm evolution. Although the total (IC + CG) lightning activity is the more representative indication of thunderstorm growth and decay, the ground strike data can be used to locate, diagnose, and track storm evolution in a number of instances. AIRBORNE ATMOSPHERIC ELECTRICITY EXPERIMENTS
Richard J. Blakeslee *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

During the 1984 U2 spring flight program, lightning spectra were measured in the wavelengths from 380 nm to 900 nm with a temporal resolution of 5 ms. With this capability, researchers simultaneously acquired both visible near-infrared lightning spectra

on a pulse to pulse basis, so that the spectral variability within a flash, as well as flash to flash variations, can be studied. Preliminary results suggest that important variations do occur, particularly in the strengths of the hydrogen and singly ionized nitrogen emission lines. Also, the results have revealed significant differences in the integrated energy distributions between the lightning spectra measured above clouds and the spectral measurements of cloud-to-ground lightning made at the ground. In particular, the ratio of the energy in the near-IR to that in the visible is around 1 to 2 for cloud top spectra versus about 1/3 for surface observations. Detailed analyses of the 1984 lightning spectral data is being conducted. This data should provide improved understanding about the optical transmission properties of thunderclouds and the physics of the lightning discharge process. Efforts continue on developing and testing background signal removal algorithms using U2 spectometer and optical array sensor day-flight data sets. The goal of this research is to develop an algorithm satisfying Lightning Mapper Sensor requirements. Author

MOBILE INTERCEPT OF STORMS
Roy T. Arnold *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The primary goal was to acquire lightning data to serve as ground truth for U2 overflights. Researchers were successful in instrumenting the Univ. of Mississippi/National Severe Storms Lab. (UM/NSSL) mobile laboratory and in coordinating storm intercept through communication to the U2 provided by airplane guidance at NSSL and through direct communication with the U2 pilot from a portable transceiver in the mobile lab. A demonstration showed that a mobile laboratory can be directed within a large geographical area and used to collect ground truth data for comparison with airborne data on a routine basis with proper utilization of forecasts, nowcasts, and communication among all participants. After the U2 flights, researchers turned their attention solely to intercepting severe storms within the area of Oklahoma with good Doppler radar coverage. They incorporated a second vehicle, which followed the mobile lab and from which they released instrumented balloons. This project utilized a standard meteorological rawinsonde and a balloon-borne electric field meter. They were successful in flying, tracking, and receiving data from mobily launched balloons on several days. Researchers believe that they have demonstrated the ability to obtain meteorological and electrical data in severe storms using instrumented balloons. This also includes the capability to launch into the mesocyclone region and for multiple launches in the same storm. Author

ANALYSIS OF DOPPLER LIDAR DATA
Jeffry Rothermel *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

Dual Doppler lidar analyses of data taken by pulsed lidars demonstrated feasibility of deriving wind fields from coordinated lidar scans. Limited case histories of thunderstorm outflows were obtained. Co-located comparison between Marshall Space Flight Center lidar and NCAR 5.5 cm radar demonstrated desirability of lidar in cases of marginal radar reflectivity in clear air and low-elevation scans. Analysis continued on backscattered intensity and velocity measurements made from April 1983 to February 1984. A slant path method was used to calculate vertical profiles of volumetric backscatter and adsorption in the lower troposphere. High-quality VAD scans were identified as candidates for investigating feasibility of calculating horizontal motion fields using single Doppler lidar. Activities during FY-85 also included participation in Fall 1984 airborne Doppler lidar flight experiments. Preliminary data review was begun using McIdas system. Analysis of backscatter and absorpiton profiles continues. Focus is on understanding spatial and temporal variations, as well as frequency distribution, of backscatter at several tropospheric levels. Results from this study provide input to evaluation of clean/dirty airmass hypothesis of aerosol distribution. Assistance is being given to preparation of a comprehensive, global backscatter measurement plan. Analysis of data from Fall 1984 flight experiments is just beginning. Work has begun on preprocessing data to minimize errors due to electro-optic modulator malfunction during flights. Author

AIRBORNE DOPPLER LIDAR ACTIVITIES
D. R. Fitzjarrald and J. W. Bilbro *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

During August and September 1984, 20 research flights were conducted by the CV990 with airborne doppler lidar installed. Nine of these flights were dedicated to the Lidar project. Excellent data were obtained in the Carquenez Strait downwind of San Francisco Bay, showing the divergence of the flow as it passes into the Central Valley. The data clearly show the horizontal and vertical structure of the wind flow in the pass region and adjoining parts of the Central Valley. Data were also obtained in the vicinity of Mount Shasta in northern California, showing the flow in the lee of the isolated mountain. Preliminary analyses of these flights using the McIdas interactive graphics system have been accomplished, and procurements have been initiated for detailed scientific analyses. A partial failure of a crucial optical component resulted in contamination of a portion of the wind data that were obtained in the Mount Shasta and subsequent flights. Analyses are underway to attempt reconstruction of the data to minimize the effects of the failure. Data were obtained in conjunction with a microwave wind profiler at Penn State University. It is expected that data reconstruction will be of use in this case. Procurement has been initiated for scientific analyses of these results. The improved airborne Lidar system performed well. In most of the research flights a large number of different scan angles were used to obtain the vertical structure of the wind fields being investigated. Author

A study was initiated to determine the influence of convective latent heat release/diabatic heating on the production of kinetic energy during AVE/SESAME I. The primary focus has been on the relative importance of thermally forced modification of the wind field through thickness and height gradient changes versus inertial-advective effects via the diabatic component of vertical motion. Preliminary results have shown that because of the strong vertical shear over the convective region, ageostrophic response is primarily caused by the latter process. The diagnostic parameterization of convective heating has been extended for use in conjunction with satellite precipitation estimates in data-poor oceanic regions. An initial application was made to a mesoscale convective system embedded in the South Pacific convergence zone. Comparison to the heating field diagnosed as a residual in the thermodynamic equation using the ECMWF III-b analyses showed that the methodology will be useful in explaining the observed heating fields and determining the relative contribution of moist processes to the total diabatic heating. Research activities are now concentrated in the following areas: (1) Determining the sensitivity of vertical heating profiles to partitioning of gridscale versus convective precipitation; (2) assessing the possible effects of incorrect analyzed gridscale vertical motions on residuals in the heat budgets computed with the ECMWF III-b data sets.

SEVERE STORM DETECTION WITH PASSIVE 37 GHz OBSERVATIONS

Roy W. Spencer, Michael R. Howland (Wisconsin Univ., Madison.), and David W. Martin *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

The research objective was to determine the information content of satellite passive 37 GHz brightness temperatures on the severity of thunderstorms through the measurement of the attenuation (scattering) signature of precipitation. The severe storm detection potential of satellite-observed passive 37 GHz radiances was evaluated by comparing Nimbus-7 Scanning Multi-channel Microwave Radiometer (SMMR) data to reports of severe weather contained in the NSSFC severe weather log for calendar years 1979 and 1980 over the United States east of the Rocky Mountains. Heavy thunderstorms have a characteristic signature in the form of localized very low 37 GHz T sub B from scattering by precipitation-size ice particles (thick cirrus being transparent at this frequency). The local noon and midnight snapshots taken by the SMMR on alternating days (with incomplete areal coverage of the U.S. on any given day) were scanned to find cases of strong scattering by precipitation, revealed by large differences between the 18 and 37 GHz brightness temperatures, the 37 GHz T sub B being at least 20 C lower than the 18 GHz T sub B. The value of the 37 GHz T sub b was then compared to severe weather reports within one hour of the SMMR observation time, in the vicinity of the SMMR-observed storm. It was found that the degree to which the T sub B were lowered was a fairly good indicator of the probability that the storm was severe. Of 263 storms observed by the SMMR during 1979 and 1980, 54 percent had severe weather associated with them for a T sub b below 203 K, while 8 percent of those above this threshold were severe.

AUTOMATED MESOSCALE WINDS DERIVED FROM GOES MULTISPECTRAL IMAGERY

Gregory S. Wilson and Robert J. Atkinson (General Electric Co., Huntsville, Ala.) *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

An automated technique for extracting mesoscale winds from sequences of GOES visible infrared spin scan radiatiometer (VISSR) image pairs has been developed, tested extensively, and configured for quasi-real time research applications on the Atmospheric Sciences Division's research computing sytem. The entire system of computer codes was successfully vectorized for execution on an array processor resulting in job turnaround in less than 1 hour. An objective quality control system provides much greater than 99 percent accuracy in eliminating questionable wind estimates. Dynamical analysis of cloud wind divergence has revealed temporally consistent convergence centers on the meso-beta scale that are highly correlated with ongoing and future developing convective storms.

SATELLITE PASSIVE MICROWAVE RAIN MEASUREMENT TECHNIQUES FOR LAND AND OCEAN

Roy W. Spencer *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

Multiseasonal rainfall was found to be measurable over land with satellite passive microwave data, based upon comparisons between Nimbus 7 Scanning Multichannel Microwave Radiometer (SMME) brightness temperatures (T sub B) and operational WSR-57 radar rain rates. All of the SMMR channels (bipolarized 37, 21, 18, 10.7, and 6.6. GHz T sub B) were compared to radar reflectivities for 25 SMMR passes and 234 radar scans over the U.S. during the spring, summer, and fall of 1979. It was found that the radar rain rates were closely related to the difference between 37 and 21 GHz T sub B. This result is due to the volume scattering effects of precipitation which cause emissivity decreases with frequency, as opposed to emissive surfaces (e.g., water) whose emissivities increase with frequency. Two frequencies also act to reduce the effects of thermometric temperature variations on T sub B to a miminum. During summer and fall, multiple correlation coefficients of 0.80 and 0.75 were obtained. These approach the limit of correlation that can be expected to exist between two very different data sources, especially in light of the errors attributable to manual digitization of PPI photographs of variable quality from various operational weather radar not calibrated for research purposes. During the spring, a significantly lower (0.63) correlation was found. This poorer performance was traced to cases of wet, unvegetated soil being sensed at the

lower frequencies through light rain, partly negating the rain scattering signal. Author

REMOTE SENSING OF SEVERE CONVECTIVE STORMS
R. J. Hung (Alabama Univ., Huntsville.), R. E. Smith, and G. S. West *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The Tibet Plateau significantly affects the initiation and development of heavy rainfall and severe storms in China, just as the Rocky Mountains influence local severe storms in the United States. The study shows that the heavy rainfall in the Plateau area is usually preceded by a high growth rate of the convective clouds, followed by a rapid collapse of the cloud top. The study also shows that the tops of the convective clouds associated with heavy rainfall over the Plateau usually lie between the altitude of the two tropopauses which exist over the Plateau. There is good agreement between the collapsing of the cloud as observed from the satellite imagery, and the beginning of the rainfall observed by the ground stations and also between the dissipation of the cloud observed from the satellite infrared imagery, and the ending of the rainfall, observed by the ground stations. Comparison of the volumetric dissipation of clouds per unit area over the location of the ground station with the rainfall recorded at that station shows a linear relationship for rainfall mounts exceeding 8 mm. The ratio of observed rainfall at the ground station over the satellite observed cloud volume dissipation per unit area was also computed. The result shows that the ratio is almost constant with the value of 9.55 mm/(pixel . km/pixel) for rainfall amounts exceeding 15 mm; and the variation is less then 10 percent for rainfall mounts between 8 and 15 mm. Needless to say, further investigation is required to verify this ratio. Author

The full-physics version of the LAMPS model has been implemented on the Perkin-Elmer computer. In Addition, LAMPS graphics processors have been rewritten to the run on the Perkin-Elmer and they are currently undergoing final testing. Numerical experiments investigating the impact of convective parameterized latent heat release on the evolution of a precipitating storm have been performed and the results are currently being evaluated. Curent efforts include the continued evaluation of the impact of initial conditions on LAMPS model results. This work will help define measurement requirements for future research field projects as well as for observations in support of operational forecasts. Also, the impact of parameterized latent heat on the evolution of precipitating systems is continuing. This research is in support of NASA's proposed Earth Observation Mission (EOM).

The importance of mesoscale moisture information in the forecasting of weather events is being studied. A test is being prepared with the March 6, 1982 Vertical Atmospheric Sounder/Atmospheric Variability Experiment (VAS/AVE) case study to be run on the sub-synoptic scale model (SSM). Intracomparison of three carefully designed simulations should isolate the role of mesoscale information in the initial conditions for both moisture and vertical motion. Three simulations will be made for the period 1200Z 6 March to 0000Z 7 March starting with the regular synoptic time data of 1200Z. The distinction between the three cases arises from data manipulation at 1800Z midway through the forecast period. Comparison of results for the 1800Z to 0000Z time period will give the information desired. Author

COOPERATIVE VAS PROGRAM WITH NASA MARSHALL SPACE FLIGHT CENTER
David D. Houghton *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The importance of mesoscale moisture information in the forecasting of weather events is discussed. A test is being prepared with the March 6, 1982 Vertical Atmospheric Sounder/Atmospheric Variability Experiment (VAS/AVE) case study to be run on the sub-synoptic scale model (SSM). Model intracomparison of three carefully designed simulations should isolate the role of mesoscale information in the initial conditions for both mositure and vertical motion. Three simulations will be made for the period 1200Z 6 March to 0000Z 7 March starting with the regular synoptic time data of 1200Z. The distinction between the three cases arises from data manipulation at 1800Z midway through the forecast period: (1) Control Case: no alterations at 1800Z. (2) Moisture Information Suppression: at 1800Z the model simulation field for water vapor, which by this time contains considerable mesoscale structure, is replaced by a smoothed version from which the mesoscale structure has been eliminated. No other variables are structure altered. (3) Vertical Motion Information Suppression: at 1800Z the model is subjected to a dead start procedure which primarily imposes a nondivergent constraint of the horizontal motion field field suppressing vertical motion. The main effect is to eliminate the mesoscale component. Comparison of results for the 1800Z to 0000Z time period will give the information desired. Author

THE ASSIMILATION OF SATELLITE SOUNDINGS, WINDS AND SATELLITE PRODUCTS IN A MESOSCALE ANALYSIS/FORECAST SYSTEM
George R. Diak and William L. Smith *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

Investigations in FY-85 were centered on three case study days in 1982. Two of these, March 6 and April 24, were Atmospheric Variability Experiment/Verical Atmospheric Sounder (AVE/VAS) days for which high spatial and temporal resolution RAOB and

Vertical Atmospheric Sounder (VAS) data sets were available. The third investigation day, April 26, was a day of interesting severe weather. In the last part of FY-84 and early FY-85 we were able to demonstrate most importantly the complimentary nature of satellite soundings and winds in a forecast/analysis system. In our variational analysis scheme, cloud drift and water vapor winds enter into the height field as gradient information. The cloud drift winds especially, have the character of supplying information in cloudy areas where satellite soundings are not possible. In the April 26 experiments, analyses and forecasts using the combination satellite winds and soundings were superior to those using only soundings. Good consistency was shown between independent satellite forecasts from different initialization times run to the same verification time. A significant accomplishment in FY-85 was expanding experiments on April 26 to include quasi-continuous initialization inserting satellite soundings and winds from several different times into an analysis/forecast. Contrary to the first set of experiments on April 26, here forecast initialization fields were not independent, but contained satellite information from two data times. Author

NUMERICAL SIMULATION OF CONVECTIVE RESPONSE TO MESOSCALE FORCING

Richard T. McNider (Alabama Univ., Huntsville.), Fred J. Kopp (South Dakota School of Mines and Technology, Rapid City.), Michael W. Kalb (Universities Space Research Association, Huntsville, Ala.), and Gregory Wilson, S. *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

A two-dimensional mesoscale model was used to initialize a two-dimensional cloud model with both mesoscale thermodynamic and dynamic information utilized in the initialization. The Mesoscale-cloud mdoel linkage was used to examine differential convective response due to mesoscale variations for the April 24, 1982 Atmospheric Variability Experiment-Vertical Atmospheric Sounder (AVE-VAS), Case 4. On this day both data analyses and mesoscale model simulations indicated strong variations in thermodynamic and dynamic structure across the panhandle of Texas where a moderately strong convective line formed. Using the cloud model, the current research has shown a preferred area for strong convection to occur due to concomitant mesoscale convergence and mesoscale destabilization of the atmosphere. Author

A SUMMARY OF RESEARCH ON MESOSCALE ENERGETICS OF SEVERE STORM ENVIRONMENTS

Henry E. Fuelberg *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

The goals of this research were to better understand interactions between areas of intense convection and their surrounding mesoscale environments by using diagnostic budgets of kinetic (KE) and available potential energy (APE). Three cases of intense convection were examined in detail. 1) Atmospheric Variability Experiments (AVE) carried out on 24 to 25 April 1975 were studied. Synoptic scale data at 3 to 6 hour intervals, contained two mesoscale convective complexes (MCCs). Analyses included total KE budgets and budgets of divergent and rotational components of KE. 2) AVE-Severe Environmental Storms and Mesoscale Experiments (SESAME)-4 carried out on 10 to 11 April 1979 were studied. Synotpic and meso alpha-scale data (250 km spacing, 3 hour intervals), contained the Red River Valley tornado outbreak. Analyses included total KE budgets (separate synoptic and mesoscale version), budgets for the divergent and rotational components, and the generation of APE by diabatic processes. 3) AVE-SESAME 5 studies were carried out on 20 to 31 May 1979. Synoptic and meso beta-scale data (75 km spacing, 1 1/2 to 3 hour intervals), contained a small MCC. Analyses include separate KE budgets for the synotic and meso beta-scales and a water vapor budget. Major findings of these investigations are: (1) The synoptic scale storm environment contains energy conversions and transports that are comparable to those of mature midlatitude cyclones. (2) Energetic in the mesoscale storm environment are often an order of magnitude larger than those in an undisturbed region. (3) Mesoscale wind maxima form in the upper troposphere on the poleward sides of convective areas, whereas speeds decrease south of storm regions. Author

TIME COMPOSITE SOUNDING

Christopher Hayden *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 1 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

In the time composite sounding mode, the Vertical Atmospheric Sounder (VAS) data is collected in a series of images of one spin each rather than in the dwell sound mode where single lines are repeatedly scanned. A drawback of the time composite method is temporal smearing of the data, but to compensate this there is also the chance that shifting cloud patterns will permit better spatial coverage. Time composite sounding was performed for a single case study, June 14, 1984. Four, ten minute single spin swaths were processed. The principal conclusion was that the time composite results were at least equivalent to the conventional dwell sounding results, despite the fact that compositing was done in a less than optimum way because of software limitations. DETECTION OF ROTATING THUNDERSTORMS USING SATELLITE IMAGERY

C. E. Anderson and Robert Schlesinger *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)

Avail: NTIS HC A07/MF A01 CSCL 04B

In the case of the Carolina tornadoes, researchers prepared visible and IR GOES imagery covering the period 2000 Z when the storm entered South Carolina from Georgia until it exited North Carolina at 0200 Z into Virginia. The GOES IR imagery clearly demonstrated that this storm was imbedded in a continuously propagating mesolow with a well defined cold dome. The ground damage track paralleled exactly with the cold dome throughout the storm's life across the Carolinas. There were no advanced very high resolution radiometer (AVHRR) data during the period to allow researchers to inspect the cloud top for warm temperature anomalies. The Carolina storm did exhibit rightward deviating outflow which was oriented about 60 degrees to the 300 mb streamlines. The tornadoes of April 27, 1984 were part of a tornado producing cold front which stretched from Oklahoma to Minnesota. As the front moved eastward it touched off numerous tornadoes in eastern Wisconsin. GOES imagery for this data was prepared and it was strikingly clear that all along the North-South oriented squall line, the individual tunderstorms had cirrus plumes which had remarkable right deviation to the upper air flow. Unlike the Carolina long track supercell cell-mesolow system, these storms

were isolated individual thunderstorms which touched off at least 16 tornadoes in eastern Wisconsin stretching from the Milwaukee area on the south to Vilas County in the north. The monster tornado of June 8, 1984 which leveled 90 percent of the village of Barneveld, Wisconsin and killed 9 persons is also discussed.

STATISTICAL ANALYSIS AND USE OF VAS RADIANCE DATA
Henry E. Fuelberg *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

Researchers goals are to describe the information content of Vertical Atmospheric Sounder (VAS) radiance data, especially the 6.7 micrometers water vapor channel, to better interpret the atmosphere's water vapor structure from 6.7 micrometers imagery, and to investigate new analysis and forecasting techniques utilizing retrieved VAS soundings. Researchers made major progress toward these goals during FY-85. They are investigating 6.7 micrometer imagery on 6 to 7 March 1982, a day when special mesoscale ground truth data were collected during the 1982 atmospheric variability experiment/vertical amospheric sounder (AVE/VAS) field experiment. A dark (dry) image streak having mesoscale details was located over the special data region, and it provides the major focus of the case study. Mesoscale radiosonde-derived humidity data are found to verify fine scale features of the image that are not evident from the standard National Weather Service network. Thus, VAS imagery is a reliable detector of mesoscale moisture structure during this case. To investigate causes for the image streak, researchers are calculating water vapor budgets. Subsidence is found to be a factor in the current case as well; however, patterns of descent are not related to the jet streak according to traditional conceptual models. Thus, it appears that more research into jet stream dynamics is needed in order to better interpret 6.7 micrometer imagery.

IMPROVED SATELLITE RETRIEVALS AND MESOSCALE MOISTURE VARIABILITY
Gary J. Jedlovec *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The investigations over the past year have led to the finalization of results from the study of mesoscale atmospheric parameters derived from the visible infrared spin scan radiometer (VISSR) atmospheric sounder (VAS). Soundings from several retrieval techniques for the 6 to 7 March 1982 special observation period were evaluated for mesoscale accuracy. Specific results and comparisons between data from a regression and two physical retrieval schemes are forthcoming in the Journal of Atmospheric and Oceanic Technology (JTech) this year. A generalization of these results is outlined. Large temperature and moisture biases existed in the VAS derived profiles, particularly in layers near inversions. Standard errors ranged from 1 to 3 C and 3 to 6 C for temperature and dewpoint, respectively. Parameters derived from VAS soundings (geopotential height, thickness, and precipitable water) often reflected the temperature and moisture profile biases. VAS derived mesoscale gradients were often weaker than those from corresponding rawinsonde data. Little improvement was made in defining the vertical structure of the atmosphere over the first guess information. VAS soundings were able to improve in the horizontal structure due to the high spatial resolution of the radiance data.

STUDIES OF HUMID CONTINENTAL HAZE DURING SPACE
David A. Bowdle and William A. Greene *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A concept for a solar radiometer network to provide supporting data during the Satellite Preciptiation and Cloud Experiment (SPACE) was developed. Each of the 9 prime and 10 supplementary SPACE ground sites will be equipped with an upward pointing global solar pyranometer. About half of the sites will also be equipped with upward pointing diffuse (shade ring) solar pyranometers, and a downward pointing global albedo pyranometer. These radiometers will be used to monitor the spatial and temporal variability of solar insolation and haze optical depth. The insolation data will ultimately be input to numerical models of the pre-storm and near-storm boundary layer. The optical depth data will be compared with simultaneous measurements from airborne and satellite-based passive visible radiometers and airborne lidars.

PRELIMINARY PLANNING FOR THE SATELLITE PRECIPITATION AND CLOUD EXPERIMENT (SPACE) FIELD PROGRAM
Steven F. Williams and Richard T. McNider *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

Preliminary planning has been performed to support NASA/Marshall Space Flight Center (MSFC) in the coordination of the field experiment to be conducted in Central Tennessee, Northern Alabama, and Mississippi during the Spring/Summer of 1986. The goal of Satellite Precipitation and Cloud Experiments (SPACE) is to investigate mesoscale cloud/precipitation systems and development of associated satellite remote sensing technology. The field program will incorporate remote sensing observations from aircraft, satellite imagery, radar observations, ground based lightning measurements, rawinsonde observations, and various surface meteorological observations. The coordination of existing and special observation networks will provide a data base for analysis of precipitation events and provide ground truth comparisons for remote sensing capabilities. Existing surface-based observational networks include National Weather Service Meso/Alpha Scale Rawinsonde, radar, and surface measurements; the Tennessee Valley Authority automated and manual precpitation recording stations; and NASA/MSFC lightning measurement stations. Special observational features to be implemented include a meso/beta scale rawinsonde network, a special surface observational network within the rawinsonde network, and the installation of a RADAP II/ICRAD data processing unit on the National Weather Service radar at Nashville, TN. Initial coordination of these observational requirements to accomplish the goals of SPACE have been performed.

ATMOSPHERIC MODELING AND SENSOR SIMULATION (AMASS) STUDY
Karen G. Parker *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 3 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

A 4800 band synchronous communications link was established between the Perkin-Elmer (P-E) 3250 Atmospheric Modeling and Sensor Simulation (AMASS) system and the Cyber 205 located at the Goddard Space Flight Center. An extension study of off-the-shelf array processors offering standard interface to the Perkin-Elmer was conducted to determine which would meet computational requirements of the division. A Floating Point Systems AP-120B was borrowed from another Marshall Space Flight Center laboratory for evaluation. It was determined that available array processors did not offer significantly more capabilities than the borrowed unit, although at least three other vendors indicated that standard Perkin-Elmer interfaces would be marketed in the future. Therefore, the recommendation was made to continue

to utilize the 1209 ad to keep monitoring the AP market. Hardware necessary to support requirements of the ASD as well as to enhance system performance was specified and procured. Filters were implemented on the Harris/McIDAS system including two-dimensional lowpass, gradient, Laplacian, and bicubic interpolation routines.

The software developed on this project in FY-84 was put into final form and documented for McIDAS user access. The various users have been asked to utilize the techniques and to provide feedback to the developers. Researchers have received limited feedback to date, but nearly all has been helpful and generally favorable. The stereo display has been used by most of the operational users of McIDAS or its progenies. Specifically, the National Hurricane Center, the National Severe Storm Forecast Center, the National Meteorological Center, and the Cape Canaveral Forecast Facility have all made use of the 4-D display techniques to help evaluate meteorological situations on various occasions. INTERACTIVE INFORMATION PROCESSING FOR NASA'S MESOSCALE ANALYSIS AND SPACE SENSOR PROGRAM
Karen G. Parker (New Technology, Inc., Huntsville, Ala.), Laura MacLean, Norman Reavis, Gregory Wilson, John S. Hickey (Atsuko Computing International, Huntsville, Ala.), Michael Dickerson, Shogo Karitani, and David Keller (Universities Space Research Association, Huntsville, Ala.) *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 14 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The Atmospheric Sciences Division (ASD) of the Systems Dynamics Laboratory at NASA's Marshall Space Flight Center (MSFC) is currently involved in interactive information processing for the Mesoscale Analysis and Space Sensor (MASS) program. Specifically, the ASD is engaged in the development and implementation of new space-borne remote sensing technology to observe and measure mesoscale atmospheric processes. These space measurements and conventional observational data are being processed together to gain an improved understanding of the mesoscale structure and the dynamical evolution of the atmosphere relative to cloud development and precipitation processes. To satisfy its vast data processing requirements, the ASD has developed a Researcher Computer System consiting of three primary computer systems which provides over 20 scientists with a wide range of capabilities for processing and displaying a large volumes of remote sensing data. Each of the computers performs a specific function according to its unique capabilities. Author

DOPPLER WIND PROFILE EXPERIMENT
James E. Arnold *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 1 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The data collection phase of a Doppler wind measurement experiment supported by high-resolution Jimsphere/FPS-16 wind data and Windsonde data was carried out at the Kennedy Space Center in February, March and early April of 1985. The Doppler wind measurements were made using a hybrid doppler profiler put in place by the Johnson Space Center and a SOUSY profiler operated by Radian Corporation. Both systems operated at 50 Mhz. Although the doppler profiler systems were located 10 km apart to enable concurrent operation of the systems for data comparison, little concurrent data were obtained due to set-up delays with the SOUSY system, and system problems with the WPL system during the last month of the test. During the test period, special serial Jimsphere soundings were taken at two-hour intervals on six days in March and April in addition to balloon soundings taken in support of the Shuttle launch operations. In addition, there is temperature, moisture and wind information available from the daily morning Radiosonde sounding taken at the Kennedy site. The balloon release point was at the same location as the SOUSY profiler. Vertical resolution of the SOUSY profiler was 150 M to approximately 20 km. The vertical resolution of the WPL profiler was 290 M to 10 km and 870 M to 17 km. Winds determined form the Jimsphere balloon have a vertical resolution of 30 M. Author

MULTISPECTRAL ATMOSPHERIC MAPPING SENSOR OF MESOSCALE WATER VAPOR FEATURES
Paul Menzel (Wisconsin Univ., Madison.), Gary Jedlovec, Greg Wilson, Robert Atkinson, and William Smith, w4560409 *In its* NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 4 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The Multispectral atmospheric mapping sensor was checked out for specified spectral response and detector noise performance in the eight visible and three infrared (6.7, 11.2, 12.7 micron) spectral bands. A calibration algorithm was implemented for the infrared detectors. Engineering checkout flights on board the ER-2 produced imagery at 50 m resolution in which water vapor features in the 6.7 micron spectral band are most striking. These images were analyzed on the Man computer Interactive Data Access System (McIDAS). Ground truth and ancillary data was accessed to verify the calibration. Author

FIRST MEETING OF THE WORKING GROUP ON THE SHUTTLE MICROWAVE PRECIPITATION RADIOMETER (SMPR)
In its NASA/MSFC FY-85 Atmospheric Processes Research Review Oct. 1985 2 p (For primary document see N87-13043 04-47)
Avail: NTIS HC A07/MF A01 CSCL 04B

The working group agreed that the first (primary) objective should be the determination of methods for the accurate measurement of total rain water and total cloud water with passive microwave methods. There was no argument on the points concerning nonlinear relationships between T sub B and rain rate (R) over the range of important rain rates (half of oceanic rainfall occurs at rates greater than 15 mm h-1), such that variations in rain rate within a footprint lead to an incorrect measurement of the average rate for that footprint, and one cannot determine the characteristics of the sensed rain area. This is especially true

near 18 GHz, where the dynamic range above 15 mm h-1 is very small because this frequency does not clearly fall in either a scattering regime or emissive regime at these wavelengths. It is also not clear whether very low frequency (emissive) techniques will be the best at measuring rain processes, or high frequency (scattering) techniques, where precipitation-size ice plays a major role in the signal attenuation. It is still not known what signal of rain is at certain rates on an observational basis because of the many different conditions that can exist within a single satellite observed footprint. Author

THE SITING, INSTALLATION AND OPERATIONAL SUITABILITY OF THE AUTOMATED WEATHER OBSERVING SYSTEM (AWOS) AT HELIPORTS Final Report, Feb. 1985- Apr. 1986
Rene A. Matos, John R. Sackett, Philip M. Shuster, and Rosanne M. Weiss Aug. 1986 70 p
(DOT/FAA/PM-86/30; DOT/FAA/CT-85/9) Avail: NTIS HC A04/MF A01

The Federal Aviation Administration (FAA) Technical Center was tasked to site, install, and evaluate an Automated Weather Observing System (AWOS) at a heliport. The conclusions of the evaluation of the AWOS at the Technical Center's Interim Concept Development Heliport are given. By using the AWOS equipment installed at the Interim Concept Development Heliport, in conjunction with literature research, the following test objectives were addressed: (1) locations in the vicinity of the heliport in which helicopter operations could influence the environment causing transient AWOS sensor performance were identified; (2) areas for sensor location near the heliport that provided the most beneficial information to the pilot were identified; (3) optimal sensor location in relationship to predominant approach and departure paths was determined; (4) siting criteria and recommendations for AWOS equipment installation at heliports were developed; (5) the operational suitability of the AWOS equipment for heliport installations was determined; and (6) additional maintenance requirements for the AWOS as the result of heliport installation were identified.

SENSITIVITY TESTS OF A SURFACE-LAYER WINDFLOW MODEL TO EFFECTS OF STABILITY AND VEGETATION
John M. Lanicci 25 Oct. 1985 54 p
(AD-A169136; AFGL-TR-85-0265; AFGL-ERP-934) Avail: NTIS HC A04/MF A01 CSCL 04/2

This study examines the sensitivity of surface-layer windflow over gently rolling terrain to different stability conditions, both with and without the effects of vegetation used to modify terrain heights and determine surface roughness. The numerical model used produces simulations of surface-layer windflow by using Gauss's Principle of Least Constraints to allow an initially uniform windfield to adjust to topography and buoyancy forces while conserving mass. The model experiments used simulated meteorological data (at only one observation point) and detailed terrain and vegetation data (on a 51-by-51 grid with 100 m spacing) for an area covering 5 by 5 km over the Fort Polk Military Reservation in Louisiana. Results show that the model simulates topographically induced flows such as cold air drainage and upslope flow, despite the simple physics employed. We also show that the presence of tall vegetation over the area (mainly coniferous and deciduous trees) alters the flow patterns under various stability conditions. These effects are shown to be caused primarily by changes in the area of chemical transport and diffusion, because they mean that even gently rolling terrain influences the surface windflow, and that tall vegetation has a considerable influence as well. A DETAILED ANALYSIS OF THE INFLUENCE OF EDDY EXCHANGE PROCESSES UPON THE DEVELOPMENT OF RADIATION FOG Final Report, 19 Sep. 1983 - 18 Mar. 1986
Ronald M. Welch Apr. 1986 41 p
(Contract DAAG29-83-K-0165)
(AD-A169233; SDSMT/IAS/R-86/03; ARO-20576.3-GS) Avail: NTIS HC A03/MF A01 CSCL 04/1

After decades of theoretical development, fog models have evolved to the point of qualitative agreement with observations. Current models are capable of simulating observed quasi-periodic oscillations in fog variables as well as the various stages of fog growth. It is now anticipated that continued efforts towards greater model sophistication will lead to at least limited quantitative agreement with observations and improved predictive capability. Application of very high resolution Landsat digital data to fog episodes has revealed the stratocumulus nature of fog. That other satellite imagery has shown little hint of this cellular structure is due to the fact that the fog elements are generally smaller than the spatial resolution available on these satellite platforms. The ratio of wavelength between cells and the height of the boundary layer is in agreement with values obtained for Benard cells and longitudinal rolls in cloud systems. The processes occurring in fogs are similar, but on a smaller scale, to those responsible for these boundary layer cloud systems. Therefore, further studies of fog processes are expected to provide quantitative information concerning the processes responsible for Benard cells, longitudinal rolls and cloud top entrainment instability. MICROMETEOROLOGICAL TRANSITIONS IN THE MORNING

BOUNDARY LAYER OVER ROLLING TERRAIN Final Report, 1982 - 1985
Allen J. Riordan and Jerry M. Davis 20 Mar. 1986 34 p
(Contract DAAG29-82-K-0183)
(AD-A169237; ARO-19649.3-GS) Avail: NTIS HC A03/MF A01 CSCL 04/2

Six years of temperature and wind data from two 60m micrometeorological towers in the piedmont of the Carolinas were analyzed. One tower was near a large lake, the other in mostly-forested terrain. Statistics of the basic tower measurements were generated and their time evolution was described for the morning transition period near sunrise. A stepwise regression model was developed and tested to predict the daily transition time at each site based on tower variables. To determine large-scale influences on the local inversion and its morning transition, the local tower data from each site were then related to the synoptic-scale pressure field over the eastern one-third of the United States. To accomplish the comparison, an objective typing scheme was developed in which the gridded daily sea-level pressure field was expressed in terms of eigenvector types. Results document the average morning transition sequence in terms of systematic changes in radiation, wind and temperatures. The regression models are quite similar at both sites and predict transition time with a least-squared regression of 0.76 for clear mornings at the forested site. The eigenvector analysis successfully categorized each day's pressure field into ten types. These showed very close association with the local inversion intensity at sunrise, but had very little relation to morning transition time at each site. Author (GRA)

(Contract F19628-83-C-0027)
(AD-A169295; P79-FINAL; AFGL-TR-85-0298) Avail: NTIS HC A08/MF A01 CSCL 04/2

An extensive literature review showed a disparity between the large amount of satellite data currently or potentially available for meteorological parameters and the relatively small amount that is actually utilized. The review also documented the various existing data retrieval techniques. Algorithms were developed and modified to retrieve temperature and moisture profiles from satellite infrared and millimeter/microwave radiances. Tools were developed, based on existing Air Force computer codes, to include and test the effect of satellite data in numerical weather prediction. The use of the logarithm of specific humidity as a forecast variable was investigated. The FGGE level II and III data sets existing at AFGL were completed to include all of the special observing periods and to form the basis of data assimilation tests. Finally, an attempt was made to optimize a cloudiness parameterization scheme on the basis of satellite retrievals. A number of recommendations are made for further work in satellite data retrieval, data assimilation and numerical weather prediction. They include the continuation of some of the items presented here, as well as suggestions for new avenues of research. GRA

REVISED UNIFORM SUMMARY OF SURFACE WEATHER OBSERVATIONS (RUSSWO). PARTS A-F, FORT RICHARDSON, ALASKA Data Summary Report, Feb. 1977 - Feb. 1986
16 Jun. 1986 292 p
(AD-A169390; USAFETAC/DS-86/025) Avail: NTIS HC A13/MF A01 CSCL 04/2

A six-part statistical data summary of surface weather observations for: FT Richardson AK. Summary consists of: PART A, Weather Conditions and Atmospheric Phenomena; PART B, Precipitation; PART C, Surface Winds; PART D, Ceiling and Visibility; PART E, Psychrometric Summaries; PART F, Pressure Summaries. See USAFETAC/TN-83/001 (AD-A123186), An Aid for Using the Revised Uniform Summary of Surface Weather Observations (RUSSWOs) for complete descriptions of contents and instructions for use. WHEELER AFB, HAWAII LIMITED SURFACE OBSERVATIONS CLIMATIC SUMMARY (LISOCS), PARTS 1-5 Data Summary Report, Jun. 1974 - May 1984
17 Jun. 1986 231 p
(AD-A169391; USAFETAC/DS-86/026) Avail: NTIS HC A11/MF A01 CSCL 04/2

A statistical data summary is given of surface weather observation climatology for Wheeler AFB, HI. This summary is similar to the Revised Uniform Summary of Surface Weather Observations (RUSSWO), but is based on data collected from limited-duty weather observing stations; i.e., those that take weather observations less than 24 hours a day, 7 days a week. The summary is in five parts: Part 1, Weather Conditions and Atmospheric Phenomena; Part 2, Surface winds; Part 3, Ceiling and Visibility; Part 4, Psychrometric summaries; and Part 5 Pressure Summaries. Note that Precipitation, is omitted. See USAFETAC/TN-83/001 9AD-A132186), An aid for Using the Revised Uniform Summary of Surface Weather Observations (RUSSWOs), for complete descriptions of contents and instructions for use. CONVERSION OF THE NOLAPS (NAVY OPERATIONAL LOCAL ATMOSPHERIC PREDICTION SYSTEM) MODEL TO THE HP9845 Final Report, 1-11 Apr. 1985
Phillip Ardanuy Feb. 1986 40 p
(Contract N00228-84-D-3155; F59-551)
(AD-A169538; NEPRF-CR-86-03) Avail: NTIS HC A03/MF A01 CSCL 04/2

As a first effort in developing an atmospheric predictive capability for the Tactical Environment Support System (TESS), the model used for the Navy Operational Local Atmospheric Prediction System (NOLAPS) is converted to the HP9845B, Option 275. Three primary steps are involved in this conversion. First, the model is converted from FORTRAN to BASIC code, made to duplicate exisiting model results, and benchmarked for time purpose. The converted model in renamed NOWLAPS (Navy Over-Water Local Atmospheric Prediction System). Second, a user-interactive capability is developed for this desk-top system. And third, an interactive graphics package is developed to display the model results. GRA

A SENSITIVITY STUDY OF A ONE-DIMENSIONAL TIME-DEPENDENT WARM CUMULUS CLOUD MODEL Scientific Report, No. 2, 1 Jan. - 31 Aug. 1985
Raina J. Eckhardt Sep. 1985 16 p
(Contract F19628-83-C-0130)
(AD-A170141; AFGL-TR-85-0331) Avail: NTIS HC A02/MF A01 CSCL 04/1

A one-dimensional time-dependent computer cloud model was initiated with a composite of two soundings from day 226 of the GATE project. The soundings were recorded on August 14, 1974 at 1200 Z, off the west coast of Africa from two ships, the Dallas (USA) and Vise (USSR). The model simulates the life cycle of a cylindrical shaped warm cumulus cloud which is in hydrostatic equilibrium. Although it is formulated in one-dimension, it includes effects from the surrounding environment by turbulent and dynamic entrainment. A series of model runs were executed in which several parameters were varied in order to observe their effects on the evolution of the model cloud. These parameters were: cloud radius, heat pulse duration, cloud condensation nuclei, and model time step duration. GRA

A REVIEW OF MICROBURSTS AND THEIR ANALYSIS AND DETECTION WITH DOPPLER RADAR M.S. Thesis
Gerald L. Freeman 1986 75 p
(AD-A170458; AFIT/CI/NR-86-98T) Avail: NTIS
HC A04/MF A01 CSCL 04/2

Microbursts are small downbursts, less than 4km in outflow size, with peak winds lasting only 2 to 5 minutes. They can be classified as either midair or surface microbursts and also either wet or dry microbursts. All microbursts are characterized by a vertical downrush of air with a divergent outflow at its base. The parent clouds associated with microbursts are: Cumulonimbus; Towering Cumulus; and Anvil Cirrus. Most origin theories credit thermodynamic factors with microburst creation. Wolfson (1983) contends that microbursts result from dynamically induced vertical pressure gradients that are intrinsic characteristics of strong mesocyclone circulation. Doppler radar is the primary tool for detecting and observing microbursts. Wind field mapping is accomplished by either a single, dual or triple radar configuration. Single radar analysis methods require the most external assumptions but are the least expensive. Multiple radar techniques provide more accuracy but are more costly. Wilson and Roberts (1983) propose a number of alternatives for realtime operational detection of microbursts in an airport environment. Of these alternatives they chose a single radar, on airport configuration as the optimum choice when considering economic feasibility as well as technical performance. Author (GRA)

HC A05/MF A01 CSCL 04/2

It is generally accepted by many scientists that a cause-effect relationship exists between solar activity and weather. Statistical evidence is provided to support this concept; atmospheric electricity and stratospheric-tropospheric exchange are highlighted. Although many accept the idea, there are those who are skeptical about such a relationship because no definite physical mechanism exists between the two. This is a topic of much discussion and debate. It is believed that the shielding of the Earth from galactic cosmic rays during increased periods of solar activity plays a key role in the process. Several of the mechanisms discussed rely on this concept. The emphasis will be on the attention in this area. On the topic of the atmospheric electrical mechanism, two hypotheses are presented: those of Markson and Hale. Finally, the stratospheric-tropospheric exchange mechanism is introduced. This mechanism is similar to the atmospheric electrical mechanism in that it also depends on the possible modulation of the thunderstorm generator by solar activity. Tropopause folding events are presented as a vital link in the stratospheric-tropospheric exchange mechanism. Author (GRA)

EFFECTS OF REDUCED SPATIAL RESOLUTION ON THE NEXRAD STORM SEQUENCE ALGORITHMS
C. McAdie May 1986 61 p
(PB86-221728; NOAA-TM-ERL-ESG-21) Avail: NTIS HC A04/MF A01 CSCL 04B

The spatial resolution of radar reflectivities obtained from NCAR's CP-2 Doppler radar on 4 June 1983, 2130-2230 G.m.t., is reduced by averaging and skipping range gates, and skipping entire rays. The number of storms identified by the NEXRAD Storm Sequence algorithms increases as the averaging of skipping interval is lengthened. Causes of the increase are ground clutter effects, multiple identification of storms, and enhanced detection of small storms. Large isolated thunderstorms are consistently identified at all spatial resolutions tested. GRA

ON THE WALKER CIRCULATION OF 1983-84
Mary Toshie Kayano, V. Brahmananda Rao, and Antonio Divino Moura Jul. 1986 16 p Submitted for publication
(INPE-3952-PRE/971) Avail: NTIS HC A02/MF A01

The El Nino - Southern Oscillation (ENSO) event of 1983 was extraordinary in many ways. First indication of positive sea surface temperature (SST) anomalies appeared in Central Pacific during the southern winter rather than near the coast of South America during the southern summer as happened in other events. By the beginning of 1983, the Southern Oscillation Index (SOI) reached a value of 3.5 standard deviations below normal, the lowest on record since 1935. Several recent papers have documented the onset phase of this event. What is not adequately discussed is the collapse phase of this ENSO event and the return to normal atmospheric conditions. Further, an overlooked aspect of this ENSO event is the associated Walker circulation and its vertical structure. In this note we show that the return to normal conditions was associated with a spectacular reversal of several atmospheric characteristics. Our calculations showed significant correlation between the SOI and one important atmospheric property, hitherto not well examined, namely, water vapor. Our results also show an awesome interconnection between such properties of the atmosphere as vertical velocity, water vapor, rainfall and thermodynamic structure to the phase of ENSO. Author

(AD-A169070; CRREL-SR-86-9) Avail: NTIS HC A04/MF A01 CSCL 20/1

The present plan is motivated by the need to improve our understanding of the fundamentals of acoustic propagation, noise, and electromagnetic remote sensing in the winter marginal ice zone (MIZ). The plan strongly emphasizes oceanography, ice dynamics, and meteorology. In fact, the latter disciplines must be deeply enough researched to resolve fundamental questions entailing air/ice/ocean interaction, heat and mass exchanges and balances, growth and decay of ice-edge eddies, etc. Detailed scientific objectives are examined for oceanography, meteorology, ice physics, remote sensing, and acoustics together with detailed experimental plans, and a discussion of logistics for these experiments. NONLINEAR INTERACTIONS IN THE MICROWAVE SENSING OF OCEANIC INTERNAL WAVES
David R. Lyzenga 15 Feb. 1986 47 p Sponsored by Navy
(AD-A169776; ERIM-155900-37-R) Avail: NTIS HC A03/MF A01 CSCL 08/3

Theories for the interaction of surface waves with internal wave-induced surface currents are reviewed, and applied to the problem of microwave sensing of internal waves. Several types of nonlinearities are discussed, including those associated with the wave-current interaction process (within the context of infinitesimal-amplitude wave theory), those associated with nonlinear surface wave dynamics, and those associated with electromagnetic scattering from nonlinear surface waves. Results of a numerical integration of the wave equation are presented and compared with linearized perturbation solutions in order to illustrate some of these nonlinearities. GRA

(AD-A170758; URI/GSO-TR-85-3) Avail: NTIS HC A09/MF A01 CSCL 08/10

The Gulf Stream Dynamics Experiment was conducted in the region just northeast of Cape Hatteras from April 1983 to May 1985 to study the propagation and growth characteristics of Gulf Stream meanders. Data collected as part of the field experiment included inverted echo sounders, current meter moorings, and AXBT survey flights. This report documents the inverted echo sounder data collected from June 1984 to May 1985. Time series plots of the half-hourly travel time and low-pass filtered thermocline depth measurements are presented for eighteen instruments. Bottom pressure and temperature, measured at four of the sites, are also plotted. Basic statistics are given for all the data records shown. Maps of the thermocline depth field in a 240 km by 460 km region are presented at daily intervals. Author (GRA)

CREW FACTORS IN FLIGHT OPERATIONS. PART 3: THE OPERATIONAL SIGNIFICANCE OF EXPOSURE TO SHORT-HAUL AIR TRANSPORT OPERATIONS
H. Clayton Foushee, John K. Lauber, Michael M. Baetge (Informatics General Corp., Palo Alto, Calif.), and Dorothea B. Acomb (San Jose State Univ., Calif.) Aug. 1986 67 p
(NASA-TM-88322; A-86338; NAS 1.15:88322) Avail: NTIS HC A04/MF A01 CSCL 06S

Excessive flightcrew fatigue has potentially serious safety consequences. Laboratory studies have implicated fatigue as a causal factor associated with varying levels of performance deterioration depending on the amount of fatigue and the type of measure utilized in assessing performance. These studies have been of limited utility because of the difficulty of relating laboratory task performance to the demands associated with the operation of a complex aircraft. The performance of 20 volunteer twin-jet transport crews is examined in a full-mission simulator scenario that included most aspects of an actual line operation. The scenario included both routine flight operations and an unexpected mechanical abnormality which resulted in a high level of crew workload. Half of the crews flew the simulation within two to three hours after completing a three-day, high-density, short-haul duty cycle (Post-Duty condition). The other half flew the scenario after a minimum of three days off duty (Pre-Duty) condition). The results revealed that, not surprisingly, Post-Duty crews were significantly more fatigued than Pre-Duty crews. However, a somewhat counter-intuitive pattern of results emerged on the crew performancemeasures. In general, the performance of Post-Duty crews was significantly better than that of Pre-Duty crews, as rated by an expert observer on a number of dimensions relevant to flight safety. Analyses of the flightcrew communication patterns revealed that Post-Duty crews communicated significantly more overall, suggesting, as has previous research, that communication is a good predictor of overall crew performance. The transduction mechanical stimuli into electrical responses is essential for audition, kinesthesis, proprioception, and autonomic sensation of pressure and volume. The primary event in transduction is the opening of an ion channel whose linkage to the cytoskeleton provides high sensitivity. When linked to adapting mechanical structures, this scheme can account for the presently known properties of various mechanical transducers.Author (GRA)

X-RAY FLUORESCENCE WITH SYNCHROTRON RADIATION
K. W. Jones, B. M. Gordon, A. L. Hanson, J. G. Pounds, and G. Schidlovsky Mar. 1986 10 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC02-76CH-00016)
(DE86-010543; BNL-38006; CONF-860829-26) Avail: NTIS HC A02/MF A01

X-ray fluorescence (XRF) has long been used to make measurements of trace element concentrations in biological materials with very high sensitivity. It has not been previously possible to work with micrometer spatial resolutions because of the relatively low brightness of X-ray tubes. This situation is much improved by using synchrotron storage ring X-ray sources since the brightness of the synchrotron source is many orders of magnitude higher than is obtained with the most intense tube sources. These intense sources open the possibility of using the XRF technique for measurements with resolutions of approximately cellular dimensions. A description of a current research project at Brookhaven which uses synchrotron radiation induced X-ray emission (SRIXE) is presented to illustrate a specific application of the method in biology. RADIOGRAPHIC DETERMINATION OF MASS AND INERTIAL TENSOR OF ANATOMICAL SEGMENTS Final Report
May 1986 43 p
(Contract N00014-85-C-0594)
(AD-A169122; ANCO-1663.15) Avail: NTIS HC A03/MF A01 CSCL 06/19

The Naval Medical Research and Development Command desires to nondestructively measure the inertial properties of nonhuman primate bodies and limbs, with possible extension to humans. The results can be used in building accurate body dynamics models for crash and seat ejection studies. ANCO has investigated the use of multi-axis radiographs (X-ray photographs) of anatomical segments with high energy photons, which allows the determination of total mass, center of gravity, and the inertia tensor. This technique does not require any knowledge of the nature of the tissues studied (or their absorption coefficient) and does not require expensive CT-scan equipment. It was concluded that by using relatively inexpensive and simple equipment, the inertial properties could be determined with an accuracy of 5% to 10%, except for the off-diagonal terms of the inertia tensor where the errors could be larger. This larger error, however, is of limited concern in body dynamic studies. GRA

HYPOTHERMIC EFFECTS ON VASCULAR CONTRACTILITY AND REACTIVITY
N. R. Bandick and D. E. Roberts 1 Jan. 1986 23 p
(AD-A169142) Avail: NTIS HC A02/MF A01 CSCL 06/19

This study compared the reactive and contractile properties of helical strips of femoral arteries taken from normothermic rabbits and rabbits that were anesthetized with pentobarbitol and cooled to 25 C at a rate of 7 C per hour. The purpose of this comparison was to see if intrinsic factors would alter the sensitivity and/or contractility of this vascular muscle to norepinephrine during whole body hypothermia. We found that, after two hours of in-vivo hypothermia, the hypothermic derived tissue was from 10 to 100X more sensitive to norepinephrine than the normothermic derived tissue. This augmented sensitivity continued while the tissue was in-vitro for at least twelve hours. The dose-response curves of the hypothermic derived arteries were shifted to the left of the normothermic arteries resulting in a greater contractility at lower levels of agonist. Moreover, the normothermic tissue contracted slower than the hypothermic. The maximal tension developed by the strips was equivalent. This study has identified prolonged alternations of receptor sensitivities and contractility properties attributable to in-vivo influences than can, in part, explain the disruptions of blood pressure during and following whole body hypothermia. GRA

QUANTIFICATION OF RESPIRATORY MUSCLE PERFORMANCE
Stephen R. Muza Jun. 1986 17 p
(AD-A169208; USARIEM-M38/86) Avail: NTIS HC A02/MF A01 CSCL 06/16

Quantification of respiratory muscle force, velocity and length are usually indirect measurements assessed from pressure, air flow and volume, respectively. Pressure produced by the respiratory muscles is measured at sites within the airways, rib cage and abdomen. Quantification of diaphragmatic tension is obtained by measurement of transdiaphragmatic pressure (P sub di) (gastric minus esophageal pressures). The strength of the inspiratory muscles working in concert is the voluntary static maximum inspiratory pressure measured at the mouth, briefly sustained near functional residual capacity (FRC). The inspiratory muscles' velocity of shortening is quantified by measuring the inspiratory flow rate (V sub I). Since the V sub I varies over the duration of inspiration (T sub I), the mean inspiratory flow rate (V sub I/T sub I) is typically used. Finally, changes in the respiratory muscles' length are inferred from measurements of volume. The duration of sustained voluntary hyperpnea is inversely related to the time-pressure integral of the diaphragm (T sub I/T sub T.P sub di/P sub di max) and the mean V sub I. Thus, measurements of pressure, flow and volume yield quantitative indices of respiratory muscle performance. GRA

ANALYSIS OF HEAD AND NECK DYNAMIC RESPONSE OF THE US ADULT MILITARY POPULATION Final Annual Technical Report, 1 Oct. 1984 - 1 Feb. 1986
A. C. Bosio and B. M. Bowman 15 Apr. 1986 135 p
(Contract N00014-81-K-0603)
(AD-A169563; UMTRI-86-14; FATR-3) Avail: NTIS HC A07/MF A01 CSCL 06/19

Mechanisms of head/neck dynamic response were investigated for NBDL volunteer data in -Gx and +Gy acceleration vectors with the MVMA 2-D and VOM 3-D Crash Victim Simulation models. Computer simulation of human subject response yielded mechanical constants pertinent to the design of a Biofidelic Manikin (BFM). Improved biofidelity for a two-joint neck model was achieved by relocating the lower neck pivot point inferior and posterior to anatomic T1. In -Gx, the magnitude and duration for condyles extension, in particular, was improved while satisfactory acceleration response was maintained. Exercising the neck model at -6Gx and -15Gx showed that it was necessary to use nonlinear stiffnesses for the lower neck joint in flexion. Two modes of extension motion at the occipital condyles were seen in the volunteer subjects. The first mode was extension with rebound (some subjects demonstrating flexion). The second mode was peak extension followed by further increase in the extension motion. The two modes of condyles extension appear to depend on some pre-test condition - probably muscle tensing since the short duration of the head and neck motion in a test (300 ms) should not allow muscular reaction beginning after the onset of the test to be a factor. Simulations with a model that has passive neck elements give only the extension with rebound response, i.e., mode one response. Thus, on the basis of simulations, it can probably be said that mode one response results for subjects who are not pretensed and mode two response results for pretensed subjects. GRA

SLEEPABILITY AND WAKEABILITY FOLLOWING SLEEP DEPRIVATION Final Report, period ending Aug. 1982
Peretz Lavie May 1986 30 p
(Contracts DAJA37-81-C-0237; DA Proj. 2Q1-61102-B-74-D)
(AD-A169578; ARI-RN-86-64) Avail: NTIS HC A03/MF A01 CSCL 06/19

This research note discusses experiments investigating the infrastructure of arousal during the habitual waking day following one night of total sleep deprivation. Based on the data collected during the experiment, it can be concluded that wakeability, the ability to remain awake, and sleepability, the ability to fall asleep, following sleep deprivation, are not complimentary processes, but are probably governed by different mechanisms. The practical implications of these results to the scheduling of replacement naps are discussed. GRA

HUMAN THERMOREGULATORY MODEL FOR IMMERSION IN COLD WATER
Peter Tikuisis, Richard R. Gonzalez, and Kent B. Pandolf Jun. 1986 35 p
(AD-A169779; USARIEM-M-39/86) Avail: NTIS HC A03/MF A01 CSCL 06/19

A mathematical model of thermoregulation has been developed to simulate human physiological responses to cold-water immersion. Data were obtained from experiments where thirteen healthy male volunteers were totally immersed under resting and nude conditions for 1 h in water temperatures of 20 and 28 C. Mean measured rectal temperature (T sub re) fell by about 0.9 and 0.5 C in 20 and 28 C water for all subjects, yet mean measured metabolic rate (M) rose by about 275 and 90 W for the lean mass group (n=7) and 195 and 45 W for the normal mass group (n=6). To predict the observed T sub re and M values, the present model differed from its predecessors by (a)determining a thermally neutral body temperature profile such that the measured and predicted initial values of T sub re and M were matched, (b)including thermal inputs for shivering from the skin independent of their inclusion with the central temperature to account for the observed initial rapid rise in M, (c)confining the initial shivering to the trunk region to avoid an overly large predicted initial rate of rectal cooling, and (d) calculating the steady state of convective heat loss by assuming a zero rate of heat storage in the skin compartment. APPLICATION OF HEART RATE MEASUREMENTS TO MARITIME RESEARCH SIMULATOR
Elliot Wald Mar. 1986 68 p
(AD-A169988; CAORF-60-7805-01) Avail: NTIS HC A04/MF A01 CSCL 06/16

An experiment was performed on the Ship Simulator of the Computer Aided Operations Research Facility (CAORF) to determine the feasibility of relating the instantaneous heart rates of test subjects with the nature of their on-bridge activity at the time of measurement. It was found that experienced mariners confronted with potential collision situations on the simulator or with difficult maneuvering problems in restricted waters generally experienced elevated heart rates indicative of increased cognitive and emotional arousal. It was also found that variability of heart rate appears to be useful in differentiatng workload demands imposed on the mariner by different navigation conditions. The fact that physiological reactions were observed to occur on the simulator in situations which would be expected to be emotionally arousing indicates, first, that the simulator is recreating, to a degree, the real-world atmosphere, and second, that heart rate measurements can be usefully applied in future research to detect emotional and or cognitive levels of arousal. Cervical spine segments were tested both nondestructively and destructively to determine the load-displacement relationships and

vertebral strength. For this study, a servo-hydraulic multi-degree of freedom material testing machine was designed and constructed. This new system, called the Planar Testing Apparatus (PTA), was used to generate motions needed to characterize the sagittal response of spine segments. A study of the viscoelastic properties of two vertebrae lumbar spine segments was conducted following the completion of the PTA to check and demonstrate the test system. The results from sever lumbar specimens were also included in this report. The cervical spine segments consisted of three vertebrae and their interconnecting soft tissue, discs, and ligaments. A noninvasive electro-mechanical displacement measuring apparatus was constructed to monitor the six degree of freedom motion of the middle vertebral body as it moved relative to the two adjacent vertebrae during the mechanical tests. Results for cervical spine specimens indicated that a low displacement rates (less than 5 mm/sec or 5 deg/sec) there was no dependence of spinal segment stiffness on displacement rate. Curves for load vs. displacement (both axila and shear) and moment vs. sagittal bending displayed large regions of small load and low slope as displacements increased. GRA

SELF-PACED HEAT ACCLIMATION PROCEDURES
Lawrence E. Armstrong, Roger W. Hubbard, Jane P. DeLuca, and Elaine L. Christensen Mar. 1986 39 p
(AD-A170533; USARIEM-T-8/86) Avail: NTIS HC A03/MF A01 CSCL 06/19

The purpose of this investigation was to evaluate the effectiveness of self-paced heat acclimation (SPHA) procedures. Fourteen males performed 100 nmin of intermittent exercise during 9 SPHA work-rest cycles, on eight days. Exercise consisted of 8.279 P or - 0.527 to 9.799 + or - 0.433 km of treadmill running per day. SPHA trials were effective in improving heat tolerance in that significant ($p < .05$) reductions were observed (day 1 vs day 8) in final heart rate (HR), Delta HR, final rectal temperatures (Tre), Delta Tre, final mean weighted skin temperature (Tsk), and Delta Tsk. Resting plasma volume expanded significantly ($p < .05$) from day 1 to day 4, but sweat rate was unchanged. Group mean exercise intensities and ratings of perceived exertion were not statistically different from days 2 7, let the number of trials terminate because subjects exceeded HR and Tre safety limits (22 out of 112 trials) declined during heat acclimation (days 1-4 = 16, days 5-8 = 6). Symptoms of heat illness (piloerection, chills, dizziness, vomiting) were observed in 16.1% of all trials; 11 out of 14 subjects (78.6%) experienced one or more or these symptoms during SPHA trials. LIMITS OF PATTERN DISCRIMINATION IN HUMAN VISION Final Report, Jan. 1983 - Dec. 1985
Joy Hirsch 3 Feb. 1986 30 p
(Contract F49620-83-C-0026)
(AD-A170756; AFOSR-86-0569TR) Avail: NTIS HC A03/MF A01 CSCL 05/10

This investigation was focused on identification of various limits of human spatial discrimination, two-dimensional sampling properties of the retinal photoreceptor lattice, and the consequences for spatial vision. Highlights from this study are briefly listed: (1) Foveal Spatial Discriminations are hyperacuity tasks; (2) The spatial-frequency discrimination function (delta f/f vs f) is segmented; (3) The discrimination segments can be related to retinal sampling; (4) Scaling mechanisms apply to low resolution tasks; (5) The photoreceptor lattice is a highly ordered hexagonal array; (6) A hexagonal component exists in spatial discrimination; and (7) A new metric model of spatial vision is based on visual sampling. PHARMACOLOGICAL RESETTING OF THE CIRCADIAN SLEEP-WAKE CYCLE Final Technical Report, 1 Apr. 1983 - 31 Mar. 1986
Martin C. Moore-Ede 30 May 1986 27 p
(Grant AF-AFOSR-0194-83)
(AD-A170804; AFOSR-86-0545TR) Avail: NTIS HC A03/MF A01 CSCL 06/16

This research program developed strategies to reset the timing of the circadian (approximately 24-hour) sleep-wake cycle so that individuals could be maintained fully awake in any predetermined time in the 24-hour day. This capability would be of direct benefit in minimizing the deleterious effects of jet-lag and could promote alertness in facilities which must be staffed 24 hours a day. The studies utilized a diurnal primate primate, the squirrel monkey (Saimiri sciureus), with a well defined circadian neurophysiology and sleep-wake physiology. This animal has a consolidated sleep-wake cycle that is comparable to that in humans. During the three-year period of funding, the circadian sleep-wake organization in squirrel monkeys was characterized, and the rate of resynchronization after phase shifts of environmental light-dark cycles was determined. BIOLOGICAL AND CLINICAL DOSIMETRY, JULY 1, 1964 TO DECEMBER 31, 1984 Final Report
J. S. Laughlin and L. Zeitz 1986 191 p
(Contract DE-AC02-76EV-03522)
(DE86-006947; DOE/EV-03522/T4) Avail: NTIS HC A09/MF A01

Systems for the determination of absorbed dose in biological research and clinical applications are developed. The primary method under study is the local absorbed dose calorimeter. In addition, secondary dosimetric systems such as ionization chambers, chemical dosimeters and thermoluminescent dosimeters (TLD) are being developed and applied to provide an absolute basis for the evaluation and comparison of experiments, treatments and other procedures using radiation. In keeping with these objectives this project has accomplished significant advances in the following areas: (1) local absorbed dose calorimetry; (2) neutron dosimetry; (3) dosimetry of ultra-high intensity radiation sources; (4) solid state detector and germanium gamma camera program; (5) dosimetry for brachytherapy; and (6) non-isolated sensor calorimeters. An optical lightning detector was constructed and flown, along with Vinton cameras and a Fairchild Line Scan Spectrometer, on a U-2 during the summer of 1979. The U-2 lightning data was obtained in daylight, and was supplemented with ground truth taken at Langmuir Laboratory. Simulations were prepared as required to establish experiment operating procedures and science training for the astronauts who would operate the Night/Day Optical Survey of Thunderstorm Lightning (NOSL) equipment during the STS-2 NOSL experiment on the Space Shuttle. Data was analyzed and papers were prepared for publication. B.G.

CREW COMMUNICATION AS A FACTOR IN AVIATION ACCIDENTS
Joseph Goguen, Charlotte Linde, and Miles Murphy Aug. 1986 29 p
(NASA-TM-88254; A-86254; NAS 1.15:88254) Avail: NTIS HC A03/MF A01 CSCL 05I

The crew communication process is analyzed. Planning and explanation are shown to be well-structured discourse types, described by formal rules. These formal rules are integrated with those describing the other most important discourse type within the cockpit: the command-and-control speech act chain. The latter is described as a sequence of speech acts for making requests (including orders and suggestions), for making reports, for supporting or challenging statements, and for acknowledging previous speech acts. Mitigation level, a linguistic indication of indirectness and tentativeness in speech, was an important variable in several hypotheses, i.e., the speech of subordinates is more mitigated than the speech of superiors, the speech of all crewmembers is less mitigated when they know that they are in either a problem or emergency situation, and mitigation is a factor in failures of crewmembers to initiate discussion of new topics or have suggestions ratified by the captain. Test results also show that planning and explanation are more frequently performed by captains, are done more during crew- recognized problems, and are done less during crew-recognized emergencies. The test results also indicated that planning and explanation are more frequently performed by captains than by other crewmembers, are done more during crew-recognized problems, and are done less during-recognized emergencies.

PERCEPTUAL FACTORS IN WORKLOAD: A NEUROMAGNETIC STUDY Annual Report, 1 Jan. - 31 Dec. 1985
Lloyd Kaufman and Samuel J. Williamson 28 Feb. 1986 55 p
(Contract F49620-85-K-0004)
(AD-A169934; AFOSR-86-0417TR; AR-1) Avail: NTIS HC A04/MF A01 CSCL 05/10

A background section describes the neuromagnetic method and its history. There were an elevation of N1 and P2 (using a quasi-steady state stimulus). The fields associated with these sources increased in intensity during attention. This is not due to the activity of sources recruited during attention, but to Modulated activity of neurons in or near primary auditory cortex. This is consistent with a Triesman like filter theory of attention. Also, physical parameters of stimulation, e.g., loudness, have little or no effects. However, the effect is sharply diminished when both stimuli are presented to both ears with equal loudness. A collaboration with other investigators is planned to compare our results with results obtained in a more conventional manner. A new method for obtaining graded levels of attention is described. A visual experiment is underway, and is giving us similar results. A single-position method for determining the location, orientation and strength of the dipole source is described. This method will be applied to a P300 study, which will follow-up an odd-ball study just completed. The latter gave results similar to those obtained previously, but the method is sufficiently insensitive to determine if changing P300 latency is due to a change in source. The planned experiment should make this possible. GRA

EYE MOVEMENTS AS AN INDEX OF MENTAL WORKLOAD Final Report, 15 Jul. 1985 - 14 Mar. 1986
James G. May, Robert S. Kennedy, Mary C. Williams, William P. Dunlap, and Julie R. Brannan 17 Mar. 1986 20 p
(Contract F49620-85-C-0121)
(AD-A169941; AFOSR-86-0416TR) Avail: NTIS HC A02/MF A01 CSCL 06/5

Two investigations were carried out to assess the feasibility of using eye movement measures as nonintrusive indicants of mental workload. In the first experiment, measures of saccadic latency and eye movement velocity were obtained during alternating eye movement scans while subjects were differentially task loaded by simple, moderate, and complex auditory tone counting. The latency and eye movement velocity measures changed but did not differ reliably as tone counting complexity (workload) was increased. In the second experiment, the spatial extent of spontaneous saccades was measured under three levels of tone counting complexity. The results indicated that the extent of such eye movements varied inversely (p less than .0151) as tone counting complexity increased. This index appears to hold promise for the development of an objective indicator of mental workload. Author (GRA)

THE FLIGHT SERVICE STATION TRAINING PROGRAM: 1981-1985 Final Report
John J. Convey Jun. 1986 18 p
(AD-A171485; DOT/FAA/AM/86-6) Avail: NTIS HC A02/MF A01 CSCL 05/9

This report describes the performance of the ATC classes in the Flight Service Station Training Program 1981 to 1985 on the skills tests and laboratory exercises in Preflight (pilot briefing), Inflight, and Emergency Services. Over 80% of the final grade for the program is based on these measures. The average scores of the classes on the skills tests, especially on Inflight, have increased from 1981 to 1985. The different forms of both the Preflight test and the Emergency Services test appear to be equivalent as intended; however, Form G and Form H of the Inflight test are easier than Form D and Form E. The average scores of the classes on the laboratory tests were constant from 1981 to 1985; however, the averages on the Inflight laboratory exercises have declined steadily. Overall, these classes have performed better on the skills tests and laboratory exercises, except for Inflight, than did the reference classes of 1978 and 1979. GRA

Anthropometric handicaps in helicopter cockpits; an obstacle-warning radar for helicopters; the workload and stress of a cockpit crew; and the simulation of human service reliability in the manual control of aircraft were studied. The system-ergonomic workload in highly automated process control tasks; and psychological workload during task-related activities were analyzed. A research method to determine the quality of task mastering by navigators in ship guidance; and the vibrations of the spinal column were tested. Human factors engineering in nuclear power plant control; and the ergonomic requirements for the design of control rooms were investigated. The possibilities of the eye-mark investigation as an anthropotechnical method to study man machine systems; measures, basic conceptions and inquiry techniques for the evaluation of man machine systems were studied. The empirical determination of the acceptable user surface in automated air conditioning systems was investigated. For individual titles, see N87-13147 through N87-13165. ESA

Avail: NTIS HC A13/MF A01

Helicopter pilots were used to test the dummy cockpit of a helicopter now under dwevelopment in order to develop a data base for the seating and the steering organs. Seated tests showed that the postures assumed by the pilots during flights generally did not agree with those envisioned in the construction specifications. This was due to the relatively large discrepancy in arm length between the 5th and the 99th percentile. To prevent their arms from getting tired, the pilots pushed the seat back farther than expected by the designer. Suggestions are also briefly made for the location of the stick and pedals. ESA

SYSTEM-ERGONOMIC WORKLOAD ANALYSIS FOR HIGHLY AUTOMATED PROCESS CONTROL TASKS [SYSTEMERGONOMISCHE BELASTUNGSANALYSEN BEI HOCHAUTOMATISIERTEN PROZESSFUEHRUNGSAUFGABEN]

B. Doering *In* DGLR Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems 1985 p 62-83 In GERMAN (For primary document see N87-13146 04-54)
Avail: NTIS HC A13/MF A01

A method to evaluate the ergonomic design of the interface operator-process guiding center in a highly automated shipbuilding industry was developed. The method determines task difficulty due to this intersection, on the basis of load factors the value of which are subjectively evaluated. The acquired information can be a basis for an improved interface design. A simulation model which reproduces the work process of the operator and the technical processes including perturbation, and which allows a comparative evaluation of different work situations was developed. The difficulties of the single tasks of the work process are classified by the model. The result of the simulation is information about the duration of the single work difficulties, as well as an integrative workload index which allows a comparative evaluation of the effects of different perturbations on the work situations. ESA

THE MEASUREMENT OF THE PSYCHOLOGICAL WORKLOAD DURING TASK-RELATED ACTIVITIES, INCLUDING CAR DRIVING, BY COMPETING TIME INTERVAL ESTIMATION [DIE MESSUNG DER PSYCHISCHEN BEANSPRUCHUNG WAEHREND AUFGANENBEZOGENER TAETIGKEITEN EINSCHLIESSLICH FAHRZEUGFUEHRUNG DURCH KONKURRIERENDE ZEITINTERVALLSCHAETZUNGEN] c53

Dieter Wiegand *In its* Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems 1985 p 84-93 In GERMAN (For primary document see N87-13146 04-54)
Avail: NTIS HC A13/MF A01

Time interval estimations were performed on subjects to determine psychological workloads of car drivers. Active time interval estimates were given by 101 subjects at rest and during activity. The estimates concerned tests related to driving and driver's choice, and a trip with a 5T truck. Distinction was made between traffic-free and traffic-loaded driving, as well as between experienced and inexperienced drivers. The results show that the dispersion of the time estimate distributions makes a highly significant distinction between the different reference loads; this is also valid for the subdivisions in the driving tests. The tests show that the measuring method is also suited for field conditions. ESA

REVIEW OF THE METHODS APPLIED IN THE FEDERAL REPUBLIC OF GERMANY TO INVESTIGATE HUMAN FACTORS IN NUCLEAR POWER PLANT CONTROL [UEBERLICK UEBER IN DER BRD ANGEWANDTE METHODEN ZUR UNTERSUCHUNG MENSCHLICHER FAKTOREN IN KERNKRALTWERKSWARTEN]

D. B. Thomas *In* DGLR Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems 1985 p 127-136 In GERMAN (For primary document see N87-13146 04-54)
Avail: NTIS HC A13/MF A01

Human factors evaluation methods for nuclear power plants are presented. Field studies provide primary information, but laboratory studies in which the variables can be manipulated without the contaminating influence of external factors, are required for predictions but are missing for German nuclear power plants and cannot simply be taken from other countries because the operational parameters are different. ESA

Avail: NTIS HC A13/MF A01

Parameters which influence the correctness of the mental model representation of unusual process evolutions were studied on a simulator in order to improve the understanding of operators in nuclear power plants. The operator's position and complex technical connections are described. Power control, steam barrier supply, and turbine condenser in a power plant are described. The simulated disturbance situation and the behavior of the operators are discussed. The results show that, even in the case of simple disturbances, error management is a very complex and diversified task. Knowledge-based, rule-based, and skill-based operator's behavior are discussed. ESA

ERGONOMIC REQUIREMENTS FOR THE DESIGN OF CONTROL ROOMS. EVALUATION METHOD [ERGONOMISCHE ANFORDERUNGEN AN DIE WARTENGESTALTUNG -BEWERTUNGSMETHODE]
W. Hinz *In* DGLR Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems 1985 p 155-164 In GERMAN (For primary document see N87-13146 04-54)
Avail: NTIS HC A13/MF A01

A method for the ergonomic qualitative evaluation of control rooms (command post, control stand) is presented. The aim was to develop design standards in order to secure suitable working conditions. Each operational situation is classified with respect to the action which the operators have to take in order to evaluate and influence the process. The method provides a starting point for a more objective evaluation, but requires expert designers because a number of evaluation criteria are lacking. ESA

Avail: NTIS HC A13/MF A01

In order to evaluate the usability of technical equipment not only the time of operation and the error rate have to be considered but also the learning process, i.e., the function time of operation versus number of repeated test trials. The analysis of data (test results), collected over many years, has shown, that the learning curve can be approximated by a simple mathematical formula; the parameters of which differ from one system, device or equipment to another but can easily be calculated. The parameters found can be used to evaluate technical equipment with respect to its usability. Such a measure of usability could enable the engineer or manager to compare technical equipment not only by technical viewpoints or costs but also by one criterion of human factors engineering. ESA

THE ECOLOGY OF MICROORGANISMS IN A SMALL CLOSED SYSTEM: POTENTIAL BENEFITS AND PROBLEMS FOR SPACE STATION
Elizabeth B. Rodgers Oct. 1986 61 p
(NASA-TM-86563; NAS 1.15:86563) Avail: NTIS HC A04/MF A01 CSCL 06K

The inevitble presence on the space station of microorganisms associated with crew members and their environment will have the potential for both benefits and a range of problems including illness and corrosion of materials. This report reviews the literature presenting information about microorganisms pertinent to Environmental Control and Life Support (ECLS) on the space station. The perspective of the report is ecological, viewing the space station as an ecosystem in which biological relationships are affected by factors such as zero gravity and by closure of a small volume of space. Potential sites and activities of microorganisms on the space station and their environmental limits, microbial standards for the space station, monitoring and control methods, effects of space factors on microorganisms, and extraterrestrial contamination are discussed. GUIDELINES FOR SAFE HUMAN EXPERIMENTAL EXPOSURE TO IMPACT ACCELERATION
Marc S. Weiss and Leonard S. Lustick 1986 33 p
(AD-A169347; NBDL-86R006) Avail: NTIS HC A03/MF A01 CSCL 06/19

The objective of the human volunteer impact experiments at the Naval Biodynamics Laboratory (NBDL) is to provide a quality data base for modeling human dynamic and phsyiological responses to impact, and for establishing the relationship between dynamic response parameters and injury. To achieve this objective, the human volunteer impact experiments must be conducted at levels of impact that may produce discomfort but are safe in as much as the experiments have an acceptably low probability of producing any permanent or irreversible injury. These safe levels of impact are derived from one or more of the following sources: (1) exposures employed in previous NBDL research with human subjects; (2) human exposure data from other research sources; (3) exposures using human surrogates/human cadavers; and, (4) mathematical modeling techniques. Based on a review of these sources, limits suggested to the Committee for the Protection of Human Subjects as safe guidelines are included. These are recommended limits for torso-restrained NBDL volunteers, where the freely moving head and neck are the anatomical segments most at risk. GRA

RAPID ACTING ELECTRO-PNEUMATIC ANTI-G SUIT CONTROL VALVE Patent Application
Robert E. VanPatten, inventor (to Air Force) Filed 24 Feb. 1986 23 p
(AD-D012377; US-Patent-Appl-SN-831901) Avail: NTIS HC A02/MF A01 CSCL 13/7

This patent application discloses a novel anti-G suit valve system which provides very rapid response to imminent high acceleration. The disclosed embodiments of the new valve system can be retrofitted to existing mechanical and anti-G valves to create a hybrid valve system capable of achieving the desired qualities of fast triggering of the valve in response to imminent acceleration and maximum rate inflation of the anti-G suit. The new valve system measures acceleration and, by differentiation, the rate of change of acceleration. When both acceleration and rate of change of acceleration exceed preselected values, a solenoid mounted in place of the press-to-test button on a mechanical anti-G valve is energized for a preselected period of time to fully depress the valve spindle, providing maximum rate delivery of pressurized air. The hybrid valve reverts to normal operation at the end of the preselected period of time. Another embodiment monitors an aircraft computer control system digital data bus and adds the requirement of detecting preselected signal values from the data bus to trigger the delivery of pressurized air. A modification of this embodiment requires only the detection of the preselected data bus signal values to initiate maximum rate delivery of pressurized air for the preselected period of time. The anti-G suit valve system may also be operated by manually determining the imminent likelihood of high acceleration and manually actuating the maximum rate delivery. GRA

IMPROVED ANTI-G SUIT Patent Application
Thomas J. Jennings, inventor (to Air Force) Filed 24 Feb. 1986 14 p
(AD-D012378; US-Patent-Appl-SN-831886) Avail: NTIS HC A02/MF A01 CSCL 15/5

This patent application discloses an improved anti-G suit which incorporates stiffening inserts sized and shaped to cover each inflatable air bladder and inserted between the bladders and the anti-G suit fabric. The stiffeners may be made of polypropylene, neoprene rubber, or a composite structure of Kevlar fabric and polyethylene. A butt strap covers the buttocks of an aircrew member and is secured by belts extending across the abdominal and the high bladders of the anti-G suit. Inflation of the air bladders pulls the strap butt to compress the butt strap tightly against the aircrew member's buttocks. GRA

HUMAN PERFORMANCE ASPECTS OF SMALL SCREEN DISPLAYS: A LITERATURE REVIEW REVEALING THE LACK OF SPECIFIC RESEARCH Final Report
Rebecca L. Shannon and Lisa J. Stewart May 1986 59 p
(Contract DAAK11-84-D-0008)
(AD-A170660; HEL-TN-5-86) Avail: NTIS HC A04/MF A01 CSCL 05/10

Literature from diverse disciplines pertinent to the human performance aspects of small screen displays was examined. In particular, four subtopics were focused on. They include: display size, defined as number of characters per number of lines; protocols, defined as ways users interact with a system to achieve their goals; abbreviations; and vocabulary. The results indicate the lack of specific research on small screen displays but also indicate a trend in current research interest and towards interest in the near future. The report points out other research trends and voids and contains an annotated bibliography of more than 100 source documents. Author (GRA)

(Grant AF-AFOSR-0052-84)
(AD-A169930; AFOSR-86-0389TR) Avail: NTIS HC A04/MF A01 CSCL 09/2

New challenges have been brought to fault-tolerant computing and processor architecture research because of developments in IC technology. One emergent area is development of architectures, built by interconnecting a large number of processing elements on a single chip or wafer. Two important areas, related to such VLSI processor arrays, are the focus of this paper; they are fault-tolerance, and yield improvement techniques. Fault-tolerance in these VLSI processor arrays is of real practical significance; it provides for much-needed reliability improvement. Therefore, we first describe the underlying concepts of fault-tolerance at work in these multi-processor systems. These precepts are useful to then present certain techniques that will incorporate fault-tolerance integrally into the design. In the second part of the paper we discuss models that evaluate how yield enhancement and reliability improvement may be achieved by certain fault-tolerant techniques. Author (GRA)

SPRINT 3: SERIAL-PARALLEL REMOTE INTERFACE SYSTEM DEVELOPMENT REPORT
J. S. Rathbun Mar. 1986 55 p
(Contract DE-AC04-76DP-00789)
(DE86-010590; SAND-84-2273) Avail: NTIS HC A04/MF A01

This development report/reference manual describes a high-speed digital Serial/Parallel Remote Interface System (SPRINT), which was developed to function as a primary data interface in the Remote Digitizing/High-Density Digital Recording system currently under development to interface the Remote Complex Wave Vibration Test Facility (Bldg. 6610) with the Central Vibration Test Control Facility (Bldg. 6650) at SNLA/AIII. The SPRINT system described in this report provides serial transmission of high-speed parallel data originating in Bldg. 6610 via synchronous fiber-optic links to Bldg. 6650, where the incoming serial data is converted back to parallel form and transferred to disc media for subsequent processing/reduction. From an input/output standpoint, the SPRINT system is electrically transparent, capable of providing parallel data through rates of up to 1 megaword/sec for 22-bit parallel input data while maintaining a serial bit-error rate of less than 10^{-15} with virtual immunity to EMI/RFI associated noise. This report will discuss the electrical characteristics and operation of the SPRINT system from both system and component-level viewpoints. DOE

A PROCEDURE FOR AUTOMATIC TREATMENT OF DYNAMIC SYSTEMS STATE OBSERVATION BIAS ERRORS
Valcir Orlando and Atair Rios Neto May 1986 8 p In PORTUGUESE; ENGLISH summary
(INPE-3908-PRE/918) Avail: NTIS HC A02/MF A01

Bias type errors are generally present in measurements either due to the equipment or to external phonomena. In this work a procedure to directly treat biased observations in the Kalman filter state estimation process, with no need of a priori bias correction, is presented. To do this a dynamic compensation process is used by modelling the observation bias as a first-order Gauss Markov dynamic process. The resulting bias dynamic equations are then incorporated into the dynamic system equations. The procedure was tested by computerized simulation of a low altitude artificial satellite orbit estimation, using range and range rate simulated tracking data considering atmospheric refraction bias errors. OBSERVATION MODEL AND PARAMETER PARTIALS FOR THE JPL VLBI PARAMETER ESTIMATION SOFTWARE MASTERFIT-1986
O. J. Sovers and J. L. Fanselow 1 Aug. 1986 68 p
(NASA-CR-179919; JPL-Pub-83-39-Rev-2; NAS 1.26:179919) Avail: NTIS HC A04/MF A01 CSCL 09B

In applications of radio interferometry to geodynamics and astrometry, observed values of delay and delay rate obtained from observations of many different radio sources must be passed simultaneously through a multiparameter estimation routine to extract the significant model parameters. As the accuracy of radio interferometry has improved, increasingly complete models for the delay and delay rate observables have been developed. The current status of the delay model used in the Jet Propulsion Laboratory multiparameter estimation program MASTERFIT is described. It is assumed that the reader has at least a cursory knowledge of the principles of very long baseline interferometery. The delay model is the sum of four major model components: geometry, clock, troposphere, and ionosphere. Current models for these components, as well as their partial derivatives with respect to parameters that are to be adjusted by multiparameter fits to the data are presented. The geometric delay is discussed. The technique used to obtain the delay rate model from the delay model is described. The values of physical constants used in MASTERFIT are given. Model improvements that may be required by more accurate data in the future are outlined. Author

TOOL TO DEVELOP REAL TIME SIMULATION SYSTEMS M.S. Thesis [FERRAMENTA PARA DESENVOLVIMENTO DE SISTEMAS DE SIMULACAO EM TEMPO REAL]
Carmen Lucia RuybaldosSantos Aug. 1986 196 p In PORTUGUESE; ENGLISH summary
(INPE-3979-TDL/233) Avail: NTIS HC A09/MF A01

The development of a tool for testing and documenting the constituent subsystems of a real time simulation system, written in FORTRAN language, is described. This tool can be seen as an environment to simulate the operation of all subsystems of the simulated system, except one: the subsystem under test. The documentation of each subsystem is attached to it. Simulation results are presented by means of tables and curves. The tool was used in perfecting the flight simulator for the Empresa Brasileira de Aeronautica (EMBRAER) T-27 airplane, developed at the Centro tecnico Aeroespacial - CTA (IPD-PEA). Accompanying the report are printouts regarding the results of a simulation and documentation for the atmosphere subsystem which is part of the simulator described above. Author

USER'S GUIDE FOR NPSOL (VERSION 4.0): A FORTRAN PACKAGE FOR NONLINEAR PROGRAMMING
Philip E. Gill, Walter Murray, Michael A. Saunders, and Margaret H. Wright Jan. 1986 60 p
(Contracts N00014-85-K-0343; DAAG29-84-K-0156)
(AD-A169115; SOL-86-2; ARO-21592.8-MA) Avail: NTIS HC A04/MF A01 CSCL 09/2

This report forms the user's guide for Version 4.0 of NPSOL, a set of Fortran subroutines designed to minimize a smooth function subject to constraints, which may include simple bounds on the variables, linear constraints and smooth nonlinear constraints. (NPSOL may also be used for unconstrained, bound-constrained and linearly constrained optimization.) The user must provide subroutines that define the objective and constraint functions and (optionally) their gradients. All matrices are treated as dense, and hence NPSOL is not intended for large sparse problems. NPSOL uses a sequential quadratic programming (SQP) algorithm, in which the search directions is the solution of a quadratic programming (QP) subproblem. The algorithm treats bounds, linear constraints and nonlinear constraints separately. The Hessian of each QP subproblem is a positive-definite quasi-Newton approximation to the Hessian of the Lagrangian function. The steplength at each iteration is required to produce a sufficient decrease an augmented Lagrangian merit function. Each QP subproblem is solved using a quadratic programming package with several features that improve the efficiency of an SPQ algorithm. Author (GRA)

SPECIAL ASSOCIATIVE PREPROCESSING STRUCTURES FOR QUALITATIVE FEATURE EXTRACTION Final Report
Michael C. Bibby 11 Jun. 1986 173 p
(AD-A169147) Avail: NTIS HC A08/MF A01 CSCL 09/2

Existing pattern recognition and classification algorithms in computer vision require vast amounts of computations on input data. As a result, memory access time is a critical parameter in system performance. Tremendous parallelism in structure and algorithm is required for the system to operate in real-time. A preprocessing structure for qualitative feature extraction which meets these system requirements is presented. In general, the structural architecture consists of a cellular array of pixel-processors each containing an inherently parallel associative memory element. As such, memory access time is minimal and parallelism is maximized. By varying this basic structure with regard to interconnection and additional logic, specific structures result which are capable of extracting measures of specific qualitative features. In this thesis two specific structures are described which extract, respectively, the qualitative features of texture regularity and line trend. Applications of these structures are presented. Low-level simulation and performance estimates indicate these applications are viable and amenable to real-time operation. Suggestions for the development of structures which extract other features or multiple features are described. GRA

AN IMPLICIT ENUMERATION ALGORITHM WITH BINARY-VALUED CONSTRAINTS
Yieh-Hwang Wan Mar. 1986 113 p
(Contract N00014-85-K-0343)
(AD-A169256; SU-SOL-86-5) Avail: NTIS HC A06/MF A01 CSCL 09/2

In many capital budgeting problems, the basic decisions simply are whether to approve or reject various capital investment proposals. This naturally gives rise to binary decision variables and an integer programming formulation of the problem. In fact, this type of problem is one of the most important areas of application of integer programming. General-purpose algorithms for binary integer programming frequently are applied to capital

budgeting problems. However, such problems generally have a great deal of special structure, including contraints for mutually exclusive alternatives, contingent alternatives, and other interdependencies. (A project which can be undertaken at different discrete levels is a good example for mutually exclusive alternatives and a simple kind of contingent alternative concerns two-stage projects, where the second stage can be undertaken only if its first stage couterpart has been undertaken already. A similar relationship also can exist between two groups of mutually exclusive alternatives.) Many group contingent constraints, which are common in capital budgeting problems and scheduling problems, are binary valued. A capital budgeting model is presented. GRA

A SOFTWARE IMPLEMENTATION OF AN INTERACTIVE GRAPHICS SYSTEM FOR THREE DIMENSIONAL MODELING AND LAYOUT M.S. Thesis
Surasak Mungsing Mar. 1986 52 p
(AD-A169264) Avail: NTIS HC A04/MF A01 CSCL 05/8

This thesis examines interactive techniques for viewing a 3-D building model in a walkthrough fashion and for placing 3-D piping into a 3-D building model. The focus of research is software implementation using the C programming language and the IRIS Graphics Library on the Silicon Graphics Inc. IRIS Turbo 2400 interactive graphics system. The first part of the research is concerned with drawing, viewing a 3-D building model, and examining interactive techniques required for building walkthrough mechanisms. The second part is concerned with the development of techniques necessary to allow the placement of 3-D piping into a 3-D building model using 2-D graphics display and a mouse device. The algorithms and implementation of these techniques are presented. GRA

LANGUAGE ACQUISITION AND MACHINE LEARNING Interim Report, Jun. - Dec. 1985
Pat Langley and Jamie G. Carbonell 1 Feb. 1986 40 p
(Contract N00014-84-K-0345)
(AD-A169581; UCI-ICS-TR-86-12; TR-4) Avail: NTIS HC A03/MF A01 CSCL 09/2

Recent progress in the field of machine learning is reviewed and implications for computational models of language acquisition examined. As a framework for understanding this research, the authors propose four component tasks involved in learning from experience-aggregation, clustering, characterization, and storage. They then consider four common problems studied by machine learning researchers, i.e., learning from examples, heuristics learning, conceptual clustering, and learning macro-operators, describing each in terms of the framework. After this, they turn to the problem of grammar acquisition, relating this problem to other learning tasks and reviewing four AI systems that have addressed the problem. Finally, they note some limitations of the earlier work and propose an alternative approach to modeling the mechanisms underlying language acquisition. Author (GRA)

THE CONTINUOUS PROJECTIVE SUMT METHOD FOR CONVEX PROGRAMMING
Garth P. McCormick 4 Jun. 1986 24 p
(AD-A169847; AD-E750914; GWU/IMSE/SERIAL-T-507/86) Avail: NTIS HC A02/MF A01 CSCL 12/1

An algorithm for solving convex programming problems is derived from the differential equations characterizing the trajectory of unconstrained minimizers of the classical logarithmic barrier function method. Convergence of this continuous Projective SUMT (sequential unconstrained minimization techniques) method to a global solution of a convex programming problem is proved under minimal assumptions. Extension of the algorithm to a form which handles linear equality constraints produces a differential equation analogue of Karmarkar's projective method for linear programming. The concluding discussion includes a discrete form of the algorithm. GRA

CATALOG OF RESOURCES FOR EDUCATION IN ADA (TRADE NAME) AND SOFTWARE ENGINEERING (CREASE), VERSION 4.0
May 1986 312 p
(Contract MDA903-83-C-0306)
(AD A169892) Avail: NTIS HC A14/MF A01 CSCL 09/2

Over the last twenty-five years software technology has made enormous strides. The Ada program serves as a focal point for the consolidation of state-of-the-art thinking about this technology. Proper use of the technology can contribute significantly to controlling the cost and improving the quality of software. However, this is a sophisticated technology, and its proper use depends upon sophisticated education and training for the people applying it. The effectiveness of the Ada programming language will be determined by the degree to which people are able to use it to implement software engineering practices in applications programming. A carefully planned education and training program, which teaches both fundamental software engineering concepts and the effective use of the Ada language, is therefore essential. This publication is intended to serve as a source of information about resources available to those who are planning such programs, with the hope that will not only serve as a ready reference, but will also increase awareness of the many aspects of education in Ada and Software Engineering. AN IMPLICIT ENUMERATION PROCEDURE FOR THE GENERAL LINEAR COMPLEMENTARITY PROBLEM

Faiz A. Al-Khayyal Jun. 1986 41 p
(Contract N00014-86-K-0173)
(AD-A170397; PDRC-86-05) Avail: NTIS HC A03/MF A01 CSCL 12/1

An algorithm is presented for solving a quadr :tic programming formulation of the linear complementarity problem. No assumptions on the problem data are required. The algorithm is designed to solve the problem by implicitly enumerating the 2 superscript n complementary cones. Geometrically, the procedure amounts to searching the extreme points of a sequence of faces of the constraint polyhedron of decreasing dimension. An extension to the procedure for finding all solutions of an arbitrary complementarity problem is also discussed. The procedure has been implemented and tested on forty randomly generated problems (up to fifty dimensional) having dense indefinite defining matrices. The results of these tests demonstrate the superiority of this approach over two competing methods. GRA

A RULE-BASED PATTERN MATCHING SYSTEM FOR THE RECOGNITION OF THREE-DIMENSIONAL LINE DRAWN OBJECTS: A FOUNDATION FOR VIDEO TRACKING
Y. S. Fong 1986 83 p
(Contract N00014-85-C-2421)
(AD-A170701) Avail: NTIS HC A05/MF A01 CSCL 09/2

Object recognition is an important subtask in image understanding, moving object tracking, and scene analysis. When identifying an object in a scene, it is essential that the same object is recognized from different view angles. Also, in cases where the object is occluded or the image is noisy, the recognition is expected to function under the existence of uncertainty. A system for object recognition, with emphasis on view angle independence, is studied. The system uses simple line drawn objects as the input image. An algorithm to extract important information from the image is developed. A rule-based pattern matching scheme is used to recognize the object in the image. In each decision made, a confidence factor is associated to indicate the system's certainty in making this decision. This study shows that the rule-based pattern matching system is a useful and flexible framework for object recognition and scene analysis. Author (GRA)

INTRODUCTION TO THE THEORY OF NESTED TRANSACTIONS
Nancy Lynch and Michael Merritt Jul. 1986 65 p Prepared in cooperation with Bell Telephone Labs., Murray Hill, N.J.
(Contracts N00014-85-K-0168; N00014-83-K-0125; DAAG29-84-K-0058; Grant NSF DCR-83-02391)
(AD-A171428; MIT/LCS/TR-367) Avail: NTIS HC A04/MF A01 CSCL 09/2

This paper develops the foundation for a general theory of nested transactions. We present a simple formal model for studying concurrency and resiliency in a nested environment. This model has distinct advantages over the many alternatives, the greatest of which is the unification of a subject replete with formalisms, correctness conditions and proof techniques. The authors are presently engaged in an ambitious project to recast the substantial amount of work in nested transactions within this single intuitive framework. These pages contain the preliminary results of that project - a description of the model, and its use in stating and proving correctness conditions for two variations of a well-known algorithm. GRA

MATRIX FACTORIZATION ON A HYPERCUBE MULTIPROCESSOR
G. A. Geist and M. T. Heath Aug. 1985 21 p Presented at the Conference on Hypercube Multiprocessors, Knoxville, Tenn. 26 Aug. 1985
(Contract DE-AC05-84OR-21400)
(DE86-011775; CONF-8508178-1) Avail: NTIS HC A02/MF A01

This paper is concerned with parallel algorithms for matrix factorization on distributed-memory, message-passing multiprocessors, with special emphasis on the hypercube. Both Cholesky factorization of symmetric positive definite matrices and LU factorization of nonsymmetric matrices using partial pivoting are considered. The use of the resulting triangular factors to solve systems of linear equations by forward and back substitutions is also considered. Efficiencies of various parallel computational approaches are compared in terms of empirical results obtained on an Intel iPSC hypercube. DOE

SINGLE-PHASE METHOD FOR QUADRATIC PROGRAMMING
S. C. Hoyle Apr. 1986 69 p
(Contract DE-AS03-76ER-72018)
(DE86-012156; SOL-86-9) Avail: NTIS HC A04/MF A01

This report describes a single-phase quadratic programming (QP) method. A need for such a method is apparent when solving a sequence of closely-related QPs. One example of this is in the area of nonlinear programming, which uses sequential quadratic programming. Another example is sensitivity analysis involving the constraints. In both of these examples, if the quadratic problem are large-scale and the initial point is infeasible, the single-phase method of this report may be particularly useful. If the Hessian is indefinite, the method will find a local minimum when solving a dense QP, and a constrained stationary point when solving a large-scale QP. If the Hessian is positive definite, it will find the global minimum. The single-phase method of this report is an active-set method which solves a sequence of equality-constrained quadratic programs (EQP). It differs from other active-set methods in that the current iterate may violate constraints in the working set (the prediction of thhe active set). Special care has been taken to avoid rank deficiency in the working set. An efficient means of solving the successive EQPs of a large-scale problem is included. Finally, an implementation of the method for dense QPs is described. DOE

USING 3-DIMENSIONAL GRAPHICS TO VISUALIZE MULTIVARIATE SCIENTIFIC DATA
S. L. Grotch Apr. 1986 15 p Presented at the Symposium on Measurement of Toxic Air Pollutants, Raleigh, N.C., 27 Apr. 1986
(Contract W-7405-eng-48)
(DE86-010788; UCRL-93658; CONF-860426-2) Avail: NTIS HC A02/MF A01

The two dimensional plot is unquestionably the most common-place graphics tool of the scientist. Yet in dealing with problems often involving high dimensionality, more sophisticated representations (such as 3D) are only infrequently used. In the work reported here, several real-world examples are used to illustrate the wide variety and the resultant interpretive potential possible through the use of three dimensional graphics. These examples are a study of climate data and of air pollution monitoring. Among the

variety of 3D plots presented are discrete point plots; mesh-like surface plots showing either theoretical or empirical model behavior; and combinations of points and surfaces. Some of the many techniques available to enhance the utility of such graphics are shown. DOE

HOMPACK: A SUITE OF CODES FOR GLOBALLY CONVERGENT HOMOTOPY ALGORITHMS
L. T. Watson, S. C. Billups (Sandia National Labs., Albuquerque, N. Mex.), and A. P. Morgan (General Motors Research Labs., Warren, Mich.) 11 Nov. 1985 26 p Presented at the SIAM National Meeting, Boston, MA., 21 Jul. 1986 Prepared in cooperation with Sandia National Labs., Albuquerque, NM.; General Motors Research Labs., Warren, MI.
(Contract DE-AC04-76DP-00789)
(DE86-011644; SAND-86-1328C; CONF-860744-1; TR-85-34) Avail: NTIS HC A03/MF A01

There are algorithms for finding zeros or fixed points of nonlinear systems of equations that are globally convergent for almost all starting points, i.e., with probability one. The essence of all such algorithms is the construction of an appropriate homotopy map and then tracking some smooth curve in the zero set of this homotopy map. HOMPACK provides three qualitatively different algorithms for tracking the homotopy zero curve: ordinary differential equation based, normal flow, and augmented Jacobian matrix. Separate routines are also provided for dense and sparse Jacobian matrices. A high level driver is included for the special case of polynomial systems. DOE

SURVEY OF THE CHARACTERISTICS OF VERY HIGH LEVEL LANGUAGES
R. S. Loffman 1986 5 p Presented at the 17th International Rochester Conference, Rochester, N.Y., 2 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-012240; CONF-8606152-1) Avail: NTIS HC A02/MF A01

Although there is no consensus on the characteristics of very high level languages (VHLLs), ample evidence exists that users of such languages have several expectations. As a result of an extensive survey of the literature and communications with researchers, it was concluded that six characteristics of VHLLs are desired. These are that the language: (1) be nonprocedural, (2) allow implicit referencing, (3) provide a good interface between user and computer, (4) allow for verification, (5) be extensible, and (6) provide the means for better data representation. It was also concluded that no existing language has all six characteristics. DOE

DISTRIBUTED NAME SERVERS: NAMING AND CACHING IN LARGE DISTRIBUTED COMPUTING ENVIRONMENTS
Douglas B. Terry Dec. 1985 133 p
(Contracts N00039-84-C-0089; ARPA Order 4871)
(AD-A169225) Avail: NTIS HC A07/MF A01 CSCL 09/2

Name services facilitate sharing in distributed environments by allowing objects to be named unambiguously and maintaining a set of application-defined attributes for each named object. Existing distributed name services, which manage names based on their syntactic structure, may lack the flexibility needed by large, diverse, and evolving computing communities. A new approach, structure-free name management, separates three activities; choosing names, selecting the storage sites for object attributes, and resolving an object's name to its attributes. Administrative entities apportion the responsibility for managing various names, while the name service's information needed to locate an object's attributes can be independently reconfigured to improve performance or meet changing demands. An analytical performance model for distributed name services provides assessments of the effect of various design and configuration choices on the cost of name service operations. Measurements of Xerox's Grapevine registration service are used as inputs to the model to demonstrate the benefits of replicating an object's attributes to coincide with sizeable localities of interest. Additional performance benefits result from client's acquiring local caches of name service data treated as hints. A cache management strategy that maintains a minimum level of cache accuracy is shown to be more effective than the usual technique of maximizing the hit ratio. Author (GRA)

AVAILABILITY AND CONSISTENCY OF GLOBAL INFORMATION IN COMPUTER NETWORKS Final Report, 1 Sep. 1983 - 31 Oct. 1985
C. V. Ramamoorthy May 1986 212 p
(Contract DAAG29-83-K-0086)
(AD-A169247; ARO-19159.3-EL) Avail: NTIS HC A10/MF A01 CSCL 09/2

A principal feature of computer networks is the ability of the

various sites of the network to access and update shared information. At the application level, the global information takes the form of shared file systems, databases, etc., and at lower levels, it takes the form of status information used in controlling the network. This research focused techniques for maintaining the availability of global information in the face of various kinds of failures and the consistency of global information in the presence of concurrency. Two failure models were considered: the crash model, in which failures are instantly detected, and the malfunction model, in which an indefinite period of time may lapse before failures are detected. A network status maintenance scheme based on a global clock facility was designed for the crash model. For the malfunction model, an approach to maintaining the correctness of global information and preventing error propagation was developed. Centralized and distributed deadlock detection algorithms were developed for distributed databases. Author (GRA)

SOAR USER'S MANUAL Report, 1 Jan. 1982 - 15 Jun. 1985
John E. Laird 31 Jan. 1986 118 p
(Contracts N00014-82-C-0067; F33615-81-K-1539)
(AD-A169005; ISL-15) Avail: NTIS HC A06/MF A01 CSCL 05/10

Soar is an architecture for general intelligence that has been applied to a variety of tasks: many of the classic artificial intelligence (AI) toy tasks such as the Tower of Hanoi, and the Blocks World; tasks that appear to involve complex, non-search reasoning, such as syllogisms, the three wise men puzzle, and sequence extrapolation; and large tasks requiring expert-level knowledge, such as the R1 computer-configuration task. This chapter provides a brief overview of the Soar architecture. In Soar, every task or problem is formulated as heuristic search in a problem space to achieve a goal. A problem space consists of a set of states and a set of operators that transform one state into another. Problem solving is the process of moving from a given initial state in the problem space through immediate states generated by operators until a desired state is reached that is recognized as attaining the goal. For each goal, there is always a single current problem space, state, and operator. The current problem space, state and operator, together with the goal, form a context. Goals (and their contexts) can have subgoals (and associated contexts), which form a strict goal-subgoal hierarchy. Soar is an architecture for problem solving and learning, based on heuristic search and chunking. GRA

A GENERALIZED PROJECTION METHOD FOR THE SOLUTION OF ALGEBRAIC LINEAR SYSTEMS
Ricardo L. U. deFreitasPinto and Atair Rios Neto Apr. 1986 21 p Sponsored by Instituto de Pesquisas Espaciais, Sao Jose dos Compos (Brazil) Submitted for publication
(INPE-3874-PRE/930) Avail: NTIS HC A02/MF A01

A sequential procedure for the solution of systems of algebraic linear equations with the number of equations less than or equal to the number of unknowns is presented. Following a strategy based on properties of matrices that can be considered as a generalization of the concept of a projection matrix, an algorithm is developed with a structure inspired in the linear estimation Kalman filter. Associated properties are presented and explored in terms of practical applications, together with numerical examples. The applications include pseudoinversion, optimization of quadratic objective functions with linear constraints, and iterative techniques for the solution of ill-conditioned linear systems. Author

THE OPTIMAL LINEAR COMBINATION OF CONTROL VARIATES IN THE PRESENCE OF BIAS
Peter W. Glynn and Donald L. Iglehart Mar. 1986 23 p
(Contract DAAG29-84-K-0030; Grant NSF ECS-84-04809)
(AD-A169111; TR-12; ARO-20927.12-MA) Avail: NTIS HC A02/MF A01 CSCL 12/1

The method of control variates has been extensively studied as a technique for obtaining variance reductions for complex simulations. The method basically requires that the practitioner be able to identify processes for which the asymptotic mean is known; the knowledge of those asymptotic means is then used to obtain a variance reduction. The authors' goal is to study a specific aspect of the small-sample theory for control variates. Their particular interest focuses on the loss of efficiency incurred when only the asymptotic mean is known, as opposed to the true (small-sample) mean. The results obtained have implications for the application of control variates to the steady-state estimation problem. Specifically, in many steady-state simulations, only the asymptotic means of the control variates are known. The results obtained here complement other small-sample studies on control variates in which the focus is on the degradation in performance caused by estimation of the optimal control coefficients. Our methods can also be used to study small-sample properties of the method of multiple estimates. GRA

AN INTUITIVE APPROACH TO GEOMETRIC CONTINUITY FOR PARAMETRIC CURVES AND SURFACES
Tony D. DeRose and Brian A. Barsky 1986 11 p
(Contracts N00039-84-C-0089; ARPA Order 4871)
(AD-A169654) Avail: NTIS HC A02/MF A01 CSCL 12/1

This report defines the nth order geometric continuity for parametric curves and surfaces, and derived the Beta constraints that are necessary and sufficient for it. Derivation of the Beta constraints is based on a simple principle of reparametrisation in conjunction with the univariate chain rule for curves, and the bivariate chain rule for surfaces. This approach uncovers the connection between geometric continuity for curves and geometric continuity for surfaces, provides new insight into the nature of geometric continuity in general, and allows the determination of the Beta constraints with less effort than previously required. Use of the Beta constraints for G to the nth power continuity allows the introduction of n shape parameters for curves, and n(n+3) shape functions for surfaces. The shape parameters and shape functions may be used to modify the shape of a geometrically continuous curve or surface, respectively. However, geometric continuity is only appropriate for applications where rate aspects of the parametrisations are unimportant since discontinuities in rate are allowed. GRA

REGULARITY OF THE SOLUTION OF ELLIPTIC PROBLEMS WITH PIECEWISE ANALYTIC DATA. PART 1: BOUNDARY VALUE PROBLEMS FOR LINEAR ELLILPTIC EQUATION OF SECOND ORDER Final Report
I. Babuska and B. Guo May 1986 73 p
(Contract N00014-85-K-0169)
(AD-A169771; BN-1047-Pt-1) Avail: NTIS HC A04/MF A01 CSCL 12/1

This paper is the first in a series devoted to the analysis of the regularity of the solution of elliptic partial differential equations with piecewise analytic data. The present paper analyzes the case of linear, second order partial differential of elliptic type. These results are essential for the design and the analysis of the h-p version of the finite element method for solving the elliptic differential equations of structural engineering. GRA

ASYMPTOTICALLY EXACT A-POSTERIORI ERROR ESTIMATOR FOR BIQUADRATIC ELEMENTS Final Report
Ivo Babuska and Dehao Yu (Academia Sinica, Beijing (China).) Jun. 1986 35 p
(Contract N00014-85-K-0169; Grant NSF DMS-83-15216)
(AD-A169798; AD-E900585; BN-1050) Avail: NTIS HC A03/MF A01 CSCL 12/1

The paper addresses the finite element method with a-posterioria error estimation for elements of degree p=1 and p=2. It gives the formulae for the error indicators and error estimators. Basic mathematical characterization of the estimators are given and it is shown that the estimators for p = 1 and p = 2 have different structures. Numerical examples show the effectivity of the approach and the high quality of the estimator. GRA

AN EXPERT-SYSTEM-LIKE FEEDBACK APPROACH IN THE HP-VERSION OF THE FINITE ELEMENT METHOD Final Report
I. Babuska and Ernst Rank May 1986 53 p
(Contract N00014-85-K-0169)
(AD-A169855; AD-E750914; BN-1048) Avail: NTIS HC A04/MF A01 CSCL 12/1

It has been theoretically shown that exponential rate of convergence in the energy norm can be obtained by a proper combination of the h- and p- extension of the finite element method for essentially all engineering problems in plane elasticity, including those with singularities in the exact solution. In this paper we present an expert system frame, which guides the user to an optimal selection of the mesh and degree distribution. After a crude preliminary computation the expert system predicts the

performance of various mesh and degree combinations and provides the analyst with rational support for his decisions about the mesh design, numerical examples show that the suggested approach gives superior results with minimum effort in human data preparation and computer time. GRA

NOTE ON A CHARACTERIZATION OF EXPONENTIAL DISTRIBUTIONS Technical Report, Sep. 1985 - Aug. 1986
Samuel Kota and F. W. Steutel Jul. 1986 5 p
(Contract N00014-84-K-0301)
(AD-A169896; UM/MSS-86/4) Avail: NTIS HC A02/MF A01 CSCL 12/1

Let U be uniformly distributed on (0,1) and let Y and Y' =(d) Y be random vectors with nonnegative components, U, Y and Y' independent. It is shown that the relation Y =(d) U(Y + Y') is satisfied if and only if the components of Y are multiples of a single exponentially distributed random variable. M.G.

SOLVING SYSTEMS OF NONLINEAR EQUATIONS BY TENSOR METHODS
Robert B. Schnabel and Paul D. Frank Jun. 1986 32 p
(Contract DAAG29-84-K-0140; NSF DCR-84-03483)
(AD-A169927; CU-CS-334-86; ARO-21453.3-MA) Avail: NTIS HC A03/MF A01 CSCL 12/1

Tensor methods are a class of general purpose methods for solving systems of nonlinear equations. They are especially intended to efficiently solve problems where the Jacobian matrix at the solution is singular or ill-conditioned, while remaining at least as efficient as standard methods on nonsingular problems. Their distinguishing feature is that they base each iteration on a quadratic model of the nonlinear function. The model has a simple second order term that allows it to interpolate more information about the nonlinear function than standard, linear model based methods, without significantly increasing the cost of forming, storing, or solving the model. This paper summarizes two types of tensor methods, derivative tensor methods that calculate an analytic or finite difference Jacobian at each iteration, and secant tensor methods that avoid Jacobian evaluations. Both are shown to require no more function or derivative information per iteration, and hardly more storage or arithmetic operations per iteration, than standard linear model based methods. Computational results are presented that indicate that both tensor methods are consistently at least as reliable as the corresponding linear model based methods, and are significantly more efficient, both cn nonsingular and on singular test problems. VALIDITY OF EDGEWORTH EXPANSIONS OF MINIMUM CONTRAST ESTIMATORS FOR GAUSSIAN ARMA PROCESSES
Masanobu Taniguchi Dec. 1985 45 p
(Contract F49620-85-C-0008)
(AD-A169931; TR-85-49; AFOSR-86-0398TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

Let (X sub t) be a Gaussian Autoregression Multivariant Analysis (ARMA) process with spectral density f sub p (lambda), where p is an unknown parameter. To estimate multivarant analysis we propose a minimum contrast estimation method which includes the maximum likelihood method and the quasi-maximum likelihood method as special cases. Let p-bar sub T be the minimum contrast estimator of p. Then we derive the Edgeworth expansion of the distribution of p-bar sub T up to third order, and provide its validity. By this Edgeworth expansion we can see that this minimum contrast estimator is always second-order asymptotically efficient in the class of second-order asymptotically median unbiased estimators. Also the third-order asymptotic comparisons among minimum contrast estimators will be discussed. GRA

ZERO-CROSSINGS ANALYSIS
Benjamin Kedem Jan. 1986 73 p
(Grant AF-AFOSR-0187-82)
(AD-A169937; AFOSR-86-0413TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

A coherent development of zero crossing based methods and theory appropriate for fast signal analysis are advanced. Quite a few ideas pertaining to zero crossing counts found in the literature can be expressed and interpreted with the help of this more general setup. A central issue addressed in some detail, is the fruitful connection which exists between zero crossing counts and linear filtering. This connection is explored and interpreted with the help of a certain zero crossing spectral representation, is then applied in spectral analysis, detection and discrimination. Zero crossing counts in filtered time series are called higher order crossings. The theme of the work is that higher order crossings analysis provides a useful descriptive as well as analytical tool that can in many respects match spectral analysis. To a great extent these two types of analysis are in fact equivalent, but each emphasizes a different point of view. Advantages offered by higher order crossings are great simplicity and a drastic data reduction. GRA

INEQUALITIES FOR PROBABILITY CONTENTS OF CONVEX SETS VIA GEOMETRIC AVERAGE
Moshe Shaked and Y. L. Tong Nov. 1985 19 p Prepared in cooperation with Georgia Inst. of Tech.
(Grants NSF MCS-82-00098; AF-AFOSR-0205-84)
(AD-A169938; AFOSR-86-0399TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper derives an inequality for a large class of density functions and a large class fo convex sets. The most general results are given for the bivariate case. An extention to the n-dimensional case appears to be difficult except for some special cases such as the case of independent identically distributed random variables or when the underlying joint density is spherically symmetric. The class of convex sets considered includes D sub infinity and D sub 2 as special cases and special applications are given for elliptically contoured distributions and scale parameters families. In all these cases, universal upper bounds on the probability contents can be given by substituting the values of the a sub i's by their geometric mean. GRA

LONG TIME ESTIMATES FOR THE HEAT KERNEL ASSOCIATED WITH A UNIFORMLY SUBELLIPIC SYMMETRIC SECOND ORDER OPERATOR
S. Kusuoka (Tokyo Univ. (Japan).) and D. Stroock Jun. 1986 39 p
(Contract DAAG29-84-K-0005; Grant NSF DMS-84-15211)
(AD-A169949; LIDS-P-1568; ARO-20980.54-MA) Avail: NTIS HC A03/MF A01 CSCL 12/1

Second order subelliptic operators have been the subject of a considerable amount of research in recent years. Starting with the paper Rothschild and Stein, in which the sharp form of Hormander's famous subellipticity theorem is proved, and continuing through the work of Fefferman and Phong and Sanchez-Calle, it has become increasingly clear that precise regularity estimates for these operators depend intimately on the geometry associated with the operator under consideration. The main purpose of this article is to obtain bounds, from above and below, on p(t,x,y), t epsilon (1, infinity), in terms of standard heat kernels. GRA

UPPER BOUNDS FOR SYMMETRIC MARKOV TRANSITION FUNCTIONS
E. A. Carlen, S. Kusuoka (Tokyo Univ. (Japan).), and D. W. Stroock Jun. 1986 52 p
(Contract DAAG29-84-K-0005; Grant NSF DMS-84-15211)

(AD-A170010; LIDS-P-1569; ARO-20980.53-MA) Avail: NTIS HC A04/MF A01 CSCL 12/1

A large number of properties which are peculiar to symmetric Markov semigroups stem from the fact that such semigroups can be analyzed simultaneously by Hilbert space techniques as well as techniques coming from maximum principle considerations. The feature of symmetric Markov semigroups in which this fact is most dramatically manifested is the central role played by the Dirichlet form. In particular, the Dirichlet form is a remarkably powerful tool with which to compare symmetric Markov semigroups. The present paper consists of a number of examples which illustrate this point. There exist tight relationships between uniform decay estimates on the semigroup and certain Sobolev like inequalities involving the Dirichlet form. GRA

THE h-p VERSION OF THE FINITE ELEMENT METHOD WITH QUASIUNIFORM MESHES Summary Report
Ivo Babuska and Manil Suri 1 May 1986 64 p
(Grants NSF DMS-83-15216; AF-AFOSR-0322-85)
(AD-A170144; MRR-86-1; AFOSR-86-0362TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

The h-p version is analyzed with a quasiuniform mesh and uniform p to get an error estimate which is simultaneously optimal in both p and h. Estimates are also proven for the h-p version when the solution has singularities in the corners of the domain and in the case when essential (Dirichlet) conditions are prescribed but are not in the subspace of finite elements. Finally, a numerical example is presented which illustrates the applicability of the developed (asymptotic) theory in a range of h and p used in practice. B.G.

EIGENVECTORS OF GRAPHS Annual Report, 1 Jul. 1985 - 1960 Jun. 1986
David L. Powers 26 Jun. 1986 11 p
(Contract N00014-85-K-0497)
(AD-A170562) Avail: NTIS HC A02/MF A01 CSCL 12/1

Let z be an eigenvector of the adjacency matrix A of a connected graph G. Say a vertix is positive, nonnegative, zero, etc. if the same is true of the corresponding element of z. If z is an eigenvector for the second largest eigenvalue of A, it is known that the nonnegative vertices of G form a connected subgraph. This separation of vertices according to sign provides the basis for studying the structure of G as revealed by its eigenvectors, inequalities on the number of edges joining positive and negative vertices, bounds on the number of zero vertices, bounds on multiplicities and some description of the variability of the elements of z. The rows of an eigenmatrix provide a mapping of the vertices of G into m-dimensional euclidean space. Some graphs thus draw themselves. This phenomenon is especially interesting if the graph is the skeleton of a polytope. GRA

SEMIGROUPS AND POISSON-APPROXIMATION Technical Report, Sep. 1985 - Aug. 1986
P. Deheuvels and D. Pfeifer Dec. 1985 13 p
(Contract F49620-85-C-0144)
(AD-A170944; AFOSR-86-0339TR; TR-132) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper extends previous work of the authors on Poisson approximation for (general) independent Bernoulli summands with respect to the total variation distance, without imposing any conditions on the underlying parameters. This enables one to study also the case of unbounded means, without asymptotic uniform smallness of the individual summands, provided that the variance increases with the same rate as the mean. An important practical situation in which such an asymptotic behavior occurs is described by Ross's Markov chain model for the Simplex Algorithm in linear programming, which will be discussed as an example of possible application. ALGORITHM FOR POSITIVE DEFINITE LEAST SQUARE ESTIMATION OF PARAMETERS
Hui Hu May 1986 17 p
(Contract DE-AS03-76ER-72018)
(DE86-012159; SOL-86-12) Avail: NTIS HC A02/MF A01

An algorithm for positive definite least square estimation of parameters is presented. This estimation problem arises from the PILOT dynamic macro-economic model and is equivalent to an infinite convex quadratic program. It differs from ordinary least square estimations in that the fitting matrix is required to be positive definite. The algorithm solves the infinite convex quadratic program by generating and solving a sequence of ordinary convex quadratic programs. By specifying a constant, the algorithm will find an approximate optimal solution after finitely many interations, or will tend to an optimal solution in the limit. The algorithm is generalized to solve a class of infinite convex programs. DOE

QUANTITATIVE ASSESSMENT OF THE EFFECT OF PARTIAL PIVOTING IN SPARSE ORDINARY DIFFERENTIAL EQUATION SOLVERS
S. Thompson May 1986 29 p
(Contract DE-AC05-84OR-21400)
(DE86-012592; ORNL-6207) Avail: NTIS HC A03/MF A01

The effect of partial pivoting in automatic ordinary differential equation solvers which utilize sparse matrix techniques is discussed. Two solvers are considered, the well-known LSODES solver and a derivate LSOD28. LSODES uses the Yale Sparse Matrix Package which does not perform partial pivoting. LSOD28 uses the Harwell MA28 Sparse Matrix Package which does perform partial pivoting. Results are presented for a benchmark problem which contains several features typically present in realistic problems. The results demonstrate that both solvers perform satisfactorily. At the same time, they demonstrate the relative effects of partial pivoting for the benchmark problem. In particular, they suggest that partial pivoting substantially improves neither the efficiency nor the reliability of LSODES for such problems. They support the argument that partial pivoting is not necessarily required in adaptive solvers to solve complex problems accurately and efficiently. DOE

QUALITY ASSESSMENT AND CONTROL OF FINITE ELEMENT SOLUTIONS Final Report
I. Babuska (Maryland Univ., College Park.) and Ahmed K. Noor May 1986 50 p Prepared in cooperation with George Washington Uni
(Grant NGR-09-010-078; Contract N00014-85-K-0169)
(NASA-TM-89208; NAS 1.15:89208; AD-A169773; BN-1049) Avail: NTIS HC A03/MF A01 CSCL 12/1

Status and some recent developments in the techniques for assessing the reliability of finite element solutions are summarized. Discussion focuses on a number of aspects including: the major types of errors in the finite element solutions; techniques used for a posteriori error estimation and the reliability of these estimators; the feedback and adaptive strategies for improving the finite element solutions; and postprocessing approaches used for improving the accuracy of stresses and other important engineering data. Also, future directions for research needed to make error estimation and adaptive movement practical are identified. Author (GRA)

STATISTICAL MODELS AND METHODS FOR CLUSTER ANALYSIS AND IMAGE SEGMENTATION Final Report, 15 Jun. 1982 - 15 Jun. 1985
Stanley L. Sclove 15 Mar. 1986 18 p
(Contract DAAG29-82-K-0155)
(AD-A169145; U1C/DQM/ARO-85-2; ARO-19085.12-MA) Avail: NTIS HC A02/MF A01 CSCL 17/8

Clustering of individuals, segmentation of time series and segmentation of numerical images can all be considered as labeling problems, for each can be described in terms of pairs (x sub t, g sub t), t = 1,2,...,n, where x sub t is the observation at instance t and g sub t is the unobservable label of instance t. The labels are to be estimated, along with any unspecified distributional parameters. In cluster analysis the values of t are the individuals (cases) observed and the x's are independent. In time series the values of t are time instants and there is temporal correlation. In numerical image segmentation the values of t denote picture elements (pixels) and spatial correlation between neighboring pixels can be utilized. The idea in segmentation is that signals and time series often are not homogeneous but rather are generated by mechanisms or processes with various phases. Similarly, images are not homogeneous but contain various objects. Segmentation is a process of attempting to recover automatically the phases or objects. Author (GRA)

ASYMPTOTIC THEORY FOR SIEVE ESTIMATORS IN SEMI-MARTINGALE REGRESSION MODELS
Ian W. McKeague Mar. 1986 35 p
(Contract DAAG29-82-K-0168)
(AD-A169207; FSU-STATISTICS-M722; TR-D-86-ARO; ARO-19367.35-MA) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper studies the estimation of functions alpha sub 1, ..., alpha sub p describing the temporal influence of p covariate processes in a regression model for semi-martingales. McKeague (1986) introduced sieve estimators for alpha sub 1, ..., alpha sub p and established consistency in sq l-norm. In this paper the asymptotic distribution theory for the integrated sieve estimators is developed. Smoothed sieve estimators are shown to be pointwise consistent and rates of convergence are provided. Author (GRA)

A REVERSAL ARGUMENT FOR STORAGE MODELS DEFINED ON SEMI-MARKOV PROCESSES
Eric S. Tollar Feb. 1986 39 p
(Contract DAAG29-82-K-0168)
(AD-A169262; FSU-TR-M721; TR-D-85-ARO; ARO-19367.36-MA) Avail: NTIS HC A03/MF A01 CSCL 12/1

For many storage models defined on some semi-Markov process X(t), the asymptotic distribution of the imbedded discrete time process can often be determined by exploiting the properties of the dual of the underlying Markov chain X sub n, which effectively reverses the process. If this is the case, a technique is given which under certain regularity conditions shows the asymptotic distribution of the entire continuous time process can be obtained, and is equal to an altered version of the reversed discrete time process. It is shown this method not only can be applied to models where the asymptotic distribution was previously unknown, but can also improve upon characterizing many of the results for models in which the asymptotic behavior is obtained by a renewal argument. Author (GRA)

A UNIFIED APPROACH TO CONSTRUCTING NONPARAMETRIC RANK TESTS
Douglas E. Critchlow 6 Jul. 1986 66 p
(Contract N00014-86-K-0156)
(AD-A169815; TR-376) Avail: NTIS HC A04/MF A01 CSCL 12/1

One shortcoming of the present theory of rank tests is that such tests have usually been constructed on a case by case basis, in a quite ad hoc (albeit clever) manner. This paper attempts to provide the basis for a more unified approach to rank tests. It investigates a general, yet simple construction, which simultaneously generates many rank test statistics, for a multitude of hypothesis testing situations. The proposed construction uses metrics on the permutation group in a novel way: the proposed test statistic is the distance between two sets of permutations. This new construction is applied systematically to the two-sample and multi-sample location problems, the two-way layout problem, the one-sample location problem, the two-sample dispersion problem with equal medians, and the problem of testing for trend. It is shown that the construction works in a variety of testing situations; gives rise to many familiar rank test statistics; produces several other test statistics which are less familiar, yet equally plausible; and enables one to extend rank tests to other hypothesis testing situations. Some connections with the existing nonparametric theory are discussed. GRA

EXTREME VALUES OF BIRTH AND DEATH PROCESSES AND QUEUES
Richard F. Serfozo 25 Mar. 1986 28 p
(Grant AF-AFOSR-0367-84)
(AD-A169932; AFOSR-86-0384TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

This document studies the asymptotic behavior of maximum values of birth and death processes over large time intervals. In most cases, the distributions of these maxima, under standard linear normalizations, either do not converge or they converge to a degenerate distribution. However, by allowing the birth and death rates to vary in a certain manner as the time interval increases, we show that the maxima do indeed have three possible limit distributions. Two of these are classical extreme value distributions and the third one is a new distribution. This third distribution is the best one for practical applications. Our results are for transient as well as recurrent birth and death processes and related queues. For transient processes, the focus is on the maxima conditioned that they are finite. Author (GRA)

SMOOTH NONPARAMETRIC QUANTILE ESTIMATION UNDER CENSORING: SIMULATIONS AND BOOTSTRAP METHODS
W. J. Padgett and L. A. Thombs May 1986 29 p
(Contract MIPR-ARO-139-85; Grant AF-AFOSR-0156-84)
(AD-A169935; TR-116; Rept-62N05-17; AFOSR-86-0431TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The objectives of this paper are two-fold. One is to report results of extensive Monte Carlo simulations which demonstrate the behavior of the mean squared error of the kernel estimator with respect to bandwidth. These simulations provide a method of choosing an optimal bandwidth when the form of the lifetime and censoring distributions are known. Also, they compare the kernel-type estimator with the product-limit qauntile estimator. Five commonly used parametric lifetime distributions, two censoring mechanisms, and four different kernel functions are considered in this study, which is an extension of the brief simulations for exponential distributions reported by Padgett (1986). The second objective is to present a nonparametric method for bandwidth selection based on the bootstrap for right-censored data. This data-based procedure used the bootstrap to estimate mean squared error, and is both an extension and modification of the methods proposed by Padgett. Bandwidth selection using the bootstrap is important for small and moderately large samples since no exact expressions exist for the mean squared error of the kernel-type quantile estimator. GRA

EXTREMAL PROCESSES, RECORD TIMES AND STRONG APPROXIMATION
Dietmar Pfeifer Dec. 1985 15 p
(Contract F49620-85-C-0144)
(AD-A169972; TR-131; AFOSR-86-0340TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Given an i.i.d. sequence of random variables (r.v.'s) with continuous cumulative distribution function (CDF) F, the author presents a simple construction for the jump times of an extremal process on the same probability space which interpolate the given record times. This gives another approach to the strong approximation of extremal processes as developed by Deheuvels (1981, 1982, 1983), and allows for a more detailed investigation of the relationship between the record times of the given sequence and the jump times of the extremal process. In particular, it is shown that the number S of surplus jump time points in (1, infinity) over the record times is approximately Poisson distributed with an exact mean of E(S) = 1 - C, C denoting Euler's constant. Hoeffding's Lemma gives an integral representation of the covariance of two random variables in terms of difference between their joint and marginal probability functions. This identity has been found to be a useful tool in studying the dependence structure of various random vectors. A generalization of this result for more than two random variables is given. This involves an integral representation of the multivariate joint cumulant. Applications of this result include characterizations of independence. Relationships with various types of dependence are also given. Author (GRA)

A BAYESIAN APPROACH TO QUANTILE AND RESPONSE PROBABILITY ESTIMATION WITH APPLICATIONS IN RELIABILITY
Moshe Shaked and Nozer D. Singpurwalla (George Washington Univ., Washington, D.C.) Aug. 1985 24 p Prepared in cooperation with George Washington Univ.
(Grant AF-AFOSR-0205-84)
(AD-A170455; AFOSR-86-0352TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper studies a Bayesian approach for the estimation of potency curve which is assumed to be nondecreasing and cocave. This is done by assigning a Dirichlet prior to transformations of some unknown parameters. The choice is made of the prior and investigate several aspects of the problem, such as the properties of the posterior distribution as well as a numerical implementation of the suggested procedure. A procedure for estimating the quantiles is also given. Applications in reliability theory are described. The procedure is illustrated numerically via an example from a government laboratory. GRA

Some probability models for classifying individuals as belonging to one of two or more populations using scale invariant discriminant functions are considered. The investigation is motivated by practical situations where the observed data on an individual are in the form of ratios of some basic measurements or measurements scaled by an unknown non-negative number. The probability models are obtained by considering a p-vector random variable X with a known distribution and deriving the distribution of the random vector Y = G(X) .1 X, where G(X) is a non-negative measure of size such that G(lambda X) = Lambda G(X) for lambda > 0. Explicit expressions are obtained for the densities of what are called

Angular Gaussian, Compositional Gaussian, Type 1 and Compositional Gaussian, Type 2 distributions. Author (GRA)

TWO ISSUES CONCERNING THE ANALYSIS OF GROUPED DATA
S. Selvin Feb. 1986 15 p Presented at the Conference of the Society for Epidemiologic Research, Pittsburg, Pa., 11 Jun. 1986
(Contract DE-AC03-76SF-00098)
(DE86-008401; LBL-20963; CONF-860694-1) Avail: NTIS HC A02/MF A01

Simple statistical models are used to illustrate two important issues arising in the analysis of grouped data. The consequences are explored of grouping continuous data and analyzing the resulting contingency table. Specifically, an expression for the loss of power is derived when an odds ratio is used to assess risk measured by a continuous variable. Also explored are the consequences of employing correlation and regression coefficients to analyze summary variables derived from grouped data (ecologic data). An expression is given that demonstrates the magnitude of a bias (ecologic fallacy) resulting from analyzing a specific type of grouped data. DOE

A method is developed to design a fixed-parameter compensator for a linear, time-invariant, SISO (single-input single-output) plant model characterized by significant structured, as well as unstructured, uncertainty. The controller minimizes the H(infinity) norm of the worst-case sensitivity function over the operating band and the resulting feedback system exhibits robust stability and robust performance. It is conjectured that such a robust nonadaptive control design technique can be used on-line in an adaptive control system. Author

APPLICATION OF A NETWORK ASSOCIATIVE SCENE ANALYSIS MODEL [EMPREGO DE UM MODELO DE REDE ASSOCIATIVA NA ANALISE DE CENAS]
Paulo Ouvera Simoni and Celso de Renna e Souza Jul. 1986 16 p In PORTUGUESE; ENGLISH summary Presented at the 2nd Portuguese Meeting of Artifical Intelligence, Lisbon, Portugal, 9-11 Oct. 1986
(INPE-3945-PRE/967) Avail: NTIS HC A01/MF A01

A knowledge representation associative network model is described, based in concept structuring and use of formulae and decision rules for relating concepts, plus part and predicate relations. The general decision rule format is such that quantified expressions may occur in the premise and in the conclusion. An inference procedure for the part relation is presented allowing a representation compression, and the problem of conflicts brought about by this procedure is discussed. For the use of the knowledge stored in the network, relative to a given application, a control mechanism is defined, with associated structures that store alterations, in the form of concept and predicate instances, that must be propagated, as well as problems for which solutions are sought. It is shown that these control structures permit forward and backward rule chaining. Characteristics of various scene analysis models are discussed, and it is shown how the control mechanism, associated to a mixed initiative process for obtaining measures, permits a generalization of these models. DUEL BETWEEN AN ASAT (ANTI-SATELLITE) WITH MULTIPLE KILL VEHICLES AND A SPACE-BASED WEAPONS PLATFORM WITH KINETIC ENERGY WEAPONS Final Report, Oct. 1984 - Dec. 1985
Pythagoras Cutchis Jan. 1986 38 p
(Contract MDA903-84-C-0031)
(AD-A168946; AD-E500768; IDA-M-144; IDA/HQ-86-30858) Avail: NTIS HC A03/MF A01 CSCL 15/3

A mathematical model is described for a duel between a ground-based anti-satellite (ASAT) and a space-based weapons platform defending itself with kinetic energy weapons. The ASAT carries one to six kill vehicles and the space platform may first attack the ASAT booster with one to three defense missiles. If the ASAT kill vehicles collectively survive the boost phase, they are each subject to a post-boost phase attack consisting of one to three defense missiles. A formula for the probability of killing the space platform with a single ASAT launch is derived as a function of the vehicle reliabilities, target detection probabilities, kill probabilities, and number of participating vehicles. Formulas are also given for the probability of kill if the space platform defends itself with a high-energy laser or with both high-energy laser and defense missiles. Illustrative examples are calculated for the case in which the space platform is defended by defense missiles only. It is assumed that all offense and defense reliabilities, detection probabilities, and kill probabilities are equal to 0.90. A sensitivity analysis illustrates the effect of a variation in any one of the assumed parameters on the probability of killing the space platform when all other parameters are held equal to 0.90. The authors describe a set of procedures for computing and updating an LU factorization of a sparse matrix A, where A may be square (possibly singular) or rectangular. The procedures include a Markowitz factorization and a Bartels-Golub update, similar to those of Reid (1976, 1982). The updates provided are addition, deletion or replacement of a row or column of A, and rank-one modification. (Previously, column replacement has been the only update available). Various design features of the implementation (LUSOL) are described, and computational comparisons are made with the LA05 and MA28 packages of Reid (1976) and Duff (1977). GRA

Development of temperature compensated magnets was undertaken in both '2:17' and NdFeB type of alloys. A number of alloys has been identified that can produce energy product in excess of 40 MGOe in the uncompensated material. Computer programs were developed for identifying key compositions that were then processed successfully into temperature compensated magnets. Current materials can produce temperature compensated magnets with an energy product not exceeding 22 MGOe. Further work is necessary to develop temperature compensated magnets with an energy product exceeding 30 MGOe. GRA

COMPUTER-BASED ESTIMATION PROCEDURE FOR COAXIAL JET NOISE. INCLUDING FAR-FIELD SUBSONIC JET MIXING NOISE DATABASE FOR STATIONARY, COPLANAR CONICAL NOZZLES
Sep. 1986 108 p Supersedes ESDU-85043
(ESDU-86019; ISBN-0-85679-571-2; ISSN-0307-0115) Avail: ESDU

This Data Item ESDU 86019 is an addition to the Noise Sub-series. A program listing is provided for interpolating within or extrapolating a data base. The variables considered make it particularly applicable to estimating noise from co-axial jets. A comprehensive data base is provided for jet mixing noise of static engines with conical nozzles, but the user may provide an alternative data base that could include installation and flight effects as well as other noise components (such as combustion and shock noise) or may supplement the provided data base with additinal data. The interpolation/extrapolation routine uses a least-squares fitting procedure in which two or three independent variables may be involved. Two of the variables are the primary jet velocity and the velocity ratio of the two streams but the third may be chosen by the user. Appropriate weighting of the data is included. The program is listed in both BASIC and FORTRAN and is available as appropriate media (magnetic tape or punched cards) as ESDUpac 1055. ESDU 85018 deals with the case of the single-stream jet. ESDU

CRUISE NOISE OF COUNTERROTATION PROPELLER AT ANGLE OF ATTACK IN WIND TUNNEL
James H. Dittmar Oct. 1986 35 p
(NASA-TM-88869; E-3275; NAS 1.15:88869) Avail: NTIS HC A03/MF A01 CSCL 20A

The noise of a counterrotation propeller at angle of attack was measured in the NASA Lewis 8- by 6-Foot Supersonic Wind Tunnel at cruise conditions. Noise increases of as much as 4 dB were measured at positive angles of attack on the tunnel side wall, which represented an airplane fuselage. These noise increases could be minimized or eliminated by operating the counterrotation propeller with the front propeller turning up-inboard. This would require oppositely rotating propellers on opposite sides of the airplane. Noise analyses at different bandwidths enabled the separate front- and rear-propeller tones, as well as the total noise, at each harmonic to be determined. A simplified noise model was explored to show how the observed circumferential noise patterns of the separate propeller tones might have occurred. The total noise pattern, which represented the sum of the front- and rear-propeller tones at a particular harmonic, showed trends that would be hard to interpret without the separate-tone results. Therefore it is important that counterrotation angle-of-attack noise data be taken in such a manner that the front- and rear-propeller tones can be separated. Author

MULTICHANNEL PHASE NOISE MEASUREMENT SYSTEM Patent Application
Stephen P. Caldwell, inventor (to Air Force) Filed 21 Apr. 1986 16 p
(AD-D012372; US-Patent-Appl-SN-853827) Avail: NTIS HC A02/MF A01 CSCL 14/2

A multichannel phase noise measuring system is disclosed which is capable of measuring the phase noise of two signal sources operating between 100 MHz and 24 GHz. This system has two input channels and a mixer which produces a difference frequency betweeen the signals received in the input channels. The difference frequency containing the phase noise is frequency multiplied and amplified to raise the phase noise level 12 dB. The

multiplied and amplified difference signal is phase locked to a commercially available frequency synthesizer with inferior noise characteristics to the units being tested. By amplifying the phase noise of the original signls above the phase noise levels of the commerically available frequency synthesizer, they become measurable. GRA

We have performed self-consistent Linearized Augmented Plane Wave calculations of the charge density of metallic beryllium, with and without warping of the interstitial potential, using the Local Density Approximation for the exchange and correlation energy functional. Overall agreement with the newest x-ray form factors is good, and it is argued that the remaining discrepancies have their source in the inadequacy of the local Density Approximation and, for some reflections, in neglecting the non-sphericity of the core charge density. Density functional theory is a form of many-body theory which maps the problem onto an equivalent single particle-like system by limiting to the ground state (or some limited ensemble). So it should be surprising that this ground state theory could have relevance to the excitation properties of a material , and yet it does when used carefully. However, the most interesting materials involve active orbitals which are at least partially localized in space and this has profound effects both on the ground state and the excitation spectrum. A long term interest is in Ce and actinide compounds such that the popular concerns are mixed valence, heavy fermions, and the various forms of magnetic transitions. Band structure calculations can give a great deal of information concerning the mechanisms and degree of the localization as shown by examples using the Ce and U L12 structured materials and the Ce cubic Laves phase materials. There are some difficulties due to an incomplete knowledge of the functionals involved which causes an underestimate of the local character. This is illustrated and discussed. DOE

MODELS AND RADIATION OF RAILGUN PLASMA ARMATURES WITH NON-IDEAL PLASMA PROPERTIES Final Report, 1 Oct. 1983 - 30 Sep. 1985
Y. C. Thio and L. S. Frost 30 May 1986 52 p
(Contract DAAG29-83-C-0030)
(AD-A169349; ARO-20115.2-EG) Avail: NTIS HC A04/MF A01 CSCL 20/7

A theoretical framework for modeling the characteristics of railgun plasma armatures is developed taking into account non ideal transport properties and equation of state. The electrical resistivity of the plasma is calculated as a sum of contributions from electron ion and electron neutral collisions. Non ideal correction to the ionization potential and pressure in Saha's equation and the equation of state is included. A steady-state magneto-gasdynamic model improved over earlier works is developed. In this model, the net Lorentz force exerted on the plasma armature is exactly accounted for. The model studies the radiation emanating from the plasma armature. It is found, on the one hand, that the radiation from the plasma armature under the conditions of most railgun experiments conducted in the past is sufficiently high to cause ablation. On the other hand, the modelling results also indicate that there indeed exist domains of operating parameters in which radiative ablation of the wall materials can be completely eliminated. Whether these favorable domains of operating parameters can be realized in practice remains a development of the future, though preliminary experiments conducted in a companion program sponsored by DoE and experiments in other institutions based upon the theoretical

recommendations developed here have produced significant reduction of ablation of the rails. GRA

COMPACT REACTOR/ORC POWER SOURCE
K. L. Meier, W. L. Kirchner, and G. J. Willcutt 1986 7 p Presented at the Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25 Aug., 1986
(Contract W-7405-eng-36)
(DE86-011252; LA-UR-86-1643; CONF-860810-7) Avail: NTIS HC A02/MF A01

A compact power source that combines an organic Rankine Cycle (ORC) electric generator with a nuclear reactor heat source is being designed and fabricated. Incorporating existing ORC technology with proven reactor technology, the compact reactor/ORC power source offers high reliability while minimizing the need for component development. Thermal power at 125 kWt is removed from the coated particle fueled, graphite moderated reactor by heat pipes operating at 500 C. Outside the reactor vessel and connected to the heat pipes are vaporizers in which the toluene ORC working fluid is heated to 370 C. In the turbine-alternator-pump (TAP) combined-rotating unit, the thermal energy of the toluene is converted to 25 kWe of electric power. Lumped parameter systems analyses combined with a finite element thermal analysis have aided in the power source design. The analyses have provided assurance of reliable multiyear normal operation as well as full power operation with upset conditions, such as failed heat pipes and inoperative ORC vaporizers. Because of inherent high reliability, long life, and insensitivity to upset conditions, this power source is especially suited for use in remote, inaccessible locations where fuel delivery and maintenance costs are high. The Los Alamos National Laboratory is involved in the design and demonstrations of a small, long-lived nuclear heat and electric power source for potential applications at remote sites where alternate fossil energy systems would not be cost effective. This paper describes the neutronic design analysis that was performed to arrive at two conceptual designs, one using thermoelectric conversion, the other using an organic Rankine cycle. To meet the design objectives and constraints a number of scoping and optimization studies were carried out. The results of calculations of control worths, temperature coefficients of reactivity and fuel depletion effects are reported. DOE

THEORY FOR COMPUTING THE FIELD SCATTERED FROM A SMOOTH INFLECTED SURFACE
Raymond L. Barger and Allen K. Dominek 1986 23 p
(NASA-TP-2632; L-16157; NAS 1.60:2632) Avail: NTIS HC A01/MF A01 CSCL 20F

A theory is described for computing the reflected or scattered field from a smooth body with inflection points. These inflections occur in certain directions at each surface point for which the total (Gaussian) curvature is zero or negative. For surface illumination in one of these critical directions, the usual reflection formulas obtained by the high-frequency approximation are inapplicable, and a shadow zone exists in the reflected field. Scattering into the shadow zone is treated, as well as specular reflection. This theory should have a variety of applications such as for certain optics problems, computer graphics modeling of three-dimensional shapes, and the design and analysis of specialized microwave reflector antennas. PHASE CONJUGATE OPTICS AND PICOSECOND OPTOELECTRONICS Final Report, 14 Feb. 1983 - 28 Feb. 1986
S. K. Kwong, G. Rakuljic, J. Paslaski, and A. Yariv 8 May 1986 13 p
(Contract DAAG29-83-K-0048)
(AD-A169180; ARO-19881.26-PH) Avail: NTIS HC A02/MF A01 CSCL 20/6

Large Coupling coefficient (>10/cm) photorefractive crystals have been developed. The infrared response and the temperature dependence of these crystals have been studied. The applications of these crystals such as image subtraction, wavefront

conversion and bistable oscillations have been developed. The ultimate bandwidth limitations of the self-pumped phase conjugate mirror have been investigated. High speed detectors for use at the 1.3 micrometers region have been developed. During this reporting period we have been conducting research on properties of photorefractive crystals and their applications, and the phase conjugation of picosecond light pulses. GRA

METHOD OF FABRICATING HIGH EFFICIENCY BINARY PLANAR OPTICAL ELEMENTS Patent Application
Wilfrid Veldkamp, inventor (to Air Force) Filed 16 Apr. 1986 43 p
(AD-D012374; US-Patent-Appl-SN-852587) Avail: NTIS HC A03/MF A01 CSCL 20/6

The high diffraction efficiency regime of binary gratings occurs at periodicities on the order of a wavelength in order to produce grating which diffract radiation with efficiencies of greater than 90%, a fabrication procedure is disclosed which uses holographic and very large scale integration techniques which allow fine control over the periodicity and depth parameters to produce binary planar optical elements having a ratio of lambda/T greater than one (where lambda equals the wavelength of an illuminating wavefront, and T equals the grating periodicity). Additionally, the disclosed process produces high optical quality diffractive elements with phase precision of as high as lambda/100. These diffractive elements include laser beam multiplexers, beam profile shapers, and binary lenses which are lossless optical transfer functions. GRA

BEAM STEERING MIRROR CONSTRUCTION Patent Application
Frederick G. Eitel, inventor (to Army) Filed 28 Apr. 1986 9 p
(AD-D012399; US-Patent-Appl-SN-856263) Avail: NTIS HC A02/MF A01 CSCL 20/6

A beam steering mirror is trunnion mounted about a primary axis relative to a ring structure. The ring structure is trunnion mounted on a secondary axis 90 deg from the primary axis of the beam steering mirror and in the same plane. The ring structure is trunnion mounted about its secondary axis relative to a stationary support structure. The ring structure and the beam steering mirror each have electric torque actuators for adjusting the beam steering mirror and the ring structure relative to the stationary support structure. GRA

METHOD AND APPARATUS FOR RAPID OPTICAL PHASING Patent Application
Mark G. Baciak, inventor (to Air Force) Filed 30 Apr. 1986 18 p
(AD-D012412; US-Patent-Appl-SN-857621) Avail: NTIS HC A02/MF A01 CSCL 20/6

This document discloses a method and apparatus for rapid optical phasing of optical devices utilizing white light interference fringe finding. The apparatus comprises a white light source, a beam splitter, a scanning mirror and a stationary reflective surface. The scanning mirror is moved in piston while reflected light is observed by an electro optic sensor at a receiver. A nulled pattern has been previously established at the receiver. An electrical signal from the electro optic sensor is mounted at amplification and recording means to identify variations in reflected light intensity that are caused by white light fringes. White light fringes only occur at zero optical difference, i.e., when the scanning mirror and stationary reflective surface are in phase. GRA

FEASIBILITY OF MAKING COHERENT FIBER-OPTIC ARRAYS FROM FUSED SILICA Final Report
J. E. Rourke, Dean J. Geraci, and Mark L. DeLong Jul. 1986 24 p
(Contract DAAA15-85-C-0111)
(AD-A170873; BRL-CR-558) Avail: NTIS HC A02/MF A01 CSCL 20/6

Coherent fiber-optic bundles offer opportunities for application of state-of-the-art electro-optic imaging techniques to the sighting and fire-control problem. However, conventional fiber-optics are limited in this application by their high attenuation coefficients (up to 2000 dB/km). Fused silica fiber with its low attenuation (1-50 dB/km), offers substantial improvement. GRA

GUIDED OPTICAL STRUCTURES IN THE MILITARY ENVIRONMENT
H. Hodara, ed. and P. Crosignani, ed. Loughton, England May 1986 310 p Meeting held in Istanbul, Turkey, 23-27 Sep. 1985
(AGARD-CP-383; ISBN-92-835-0391-0) Avail: NTIS HC A14/MF A01

A new technology has arisen and is expanding quickly; single

mode structures in the form of optical fibers and planar waveguides operating at long wavelength, 1.3 micron and beyond, with minimum attenuation and dispersion. Fibers with attenuation below 0.5 dB/km, and bandwidths in the hundreds of GHz-Km have opened up long distance, repeaterless transmission on land and underwater. In addition, the single mode structure has bred a new class of passive devices: sensors capable of detecting sound, magnetic field, motion, temperature, humidity and many other characteristics, all of them approaching the theoretical detection limit. New active components are developing: single mode, high efficiency, long life chips operating at room temperature, electro-optic switches and components capable of generating new frequencies through Raman scattering and other nonlinear phenomena. For individual titles, see N87-13274 through N87-13306.

COMPARISON OF RING LASER AND FIBER-OPTIC GYRO TECHNOLOGY
E. Udd, S. F. Watanabe, and R. F. Cahill *In* AGARD Guided Optical Structures in the Military Environment May 1986 14 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Substantial progress has been made in recent years toward the development of producible fiber-optic rotation sensors. These devices have the potential of being the solid-state replacement for many applications currently using mechanical gyro technology. Ring laser gyro technology which has been under development for approximately 23 years is now being introduced into commercial and military aircraft for inertial navigation. The fundamentals of the usage of Sagnac interferometry for rotation sensing is reviewed as well as the differences between fiber-optic gyro and ring laser gyro technology. Examples are given of applications where fiber-optic gyro or ring laser gyro technology is particularly suitable. Distinctions are made between analog fiber-optic gyros which offer the lowest possible cost but are limited in performance capability and digital fiber-optic gyros which offer the wide dynamic range and accurate scale factor correction required for more stringent applications. CLOSED LOOP FIBER OPTIC GYRO
D. H. Lewis, B. Bednarz, J. A. Dankowych, K. Jew, G. Joslin, and W. A. Young *In* AGARD Guided Optical Structures in the Military Environment May 1986 10 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

A breadboard closed loop gyroscope using ordinary single mode fiber and a multi-mode diode laser is described. Closed loop rotation rate bias stability data are presented for both short term and long term. The performance of the gyro is displayed in the frequency domain as well as in the time domain. The performance achieved was a rotation rate noise of 5 deg/hr for 1 sec. integration, 0.55 deg/hr for 100 second integration and an extrapolated drift of 0.09 deg/hr. The long term (6 hours) bias stability was 1 deg/hr. Author

MAGNETIC AND PRESSURE SENSORS USING THE COMPENSATED POLARIMETRIC SENSOR CONFIGURATION
J. P. Dakin, C. R. Batchellor, and J. A. Rex *In* AGARD Guided Opitcal Structures in the Military Environment May 1986 7 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The identical lengths of high birefringence fiber spliced together with a 90 deg axial rotation to couple their orthogonal birefringent axes form the basis of a compensated polarimetric optical fiber sensor. This can be used to detect differential strains in the two fiber lengths caused by such phenomena as hydrostatic pressure or magnetic fields (the strain being introduced by magnetostrictive material bonded to the fiber). Magnetic and pressure sensors were constructed using this principle and show good sensitivity yet better stability then Mach-Zehnder arrangements. Author

A STUDY OF METHODS OF PHASE NOISE REDUCTION OF SEMICONDUCTOR LASERS FOR SENSOR APPLICATIONS
J. P. Dakin and P. B. Withers *In* AGARD Guided Optical Structures in the Military Environment May 1986 7 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Many optical sensors based on fiber interferometry have been proposed. The majority of these use interferometers of the Mach-Zehnder or Michelson type, in which the optical path lengths of the two arms are often unequal. Under these conditions, a highly coherent light source is necessary to avoid signal/noise degradation due to fluctuations in the phase or frequency of the source. Single mode gas lasers are sufficiently coherent, but their large size, critical alignment requirements, and cost, limit their appeal as light sources for optical sensors. Semiconductor lasers, however, are compact, rugged and potentially low-priced devices, but the magnitude of the phase noise is such that, to obtain microradian sensitivity in interferometric sensors, only path differences less than one millimetre between the signal and reference arms can be tolerated. This imbalance may be increased if the magnitude of the laser phase noise can be reduced using either passive optical feedback or active control of the laser drive current. Both approaches are described. Described first are proposed experiments to examine the feasibility of using an array of suitably spaced mirrors to provide passive optical feedback. Secondly, experiments to measure phase noise reduction produced by active control of the laser drive current are reported together with their results. Author

EFFECTS OF OPTICAL FEEDBACK ON THE PERFORMANCE OF HIGH DATA RATE SINGLE-MODE FIBER SYSTEMS
R. Keil, K. Mathyssek, and E. Hoermann *In* AGARD Guided Optical Structures in the Military Environment May 1986 15 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Performance measurements data accomplished on a 678 Mbit/s single-mode fiber optic transmission system for various laser diode structures and more importantly under different near- and far-end optical feedback conditions are presented. Specifically, for two integral coupling schemes i.e., the drawn fiber taper with a lens and hemispherically ended graded index fiber lens (GRINFLENS) the near-end optical feedback are modelled and

simple method for its experimental assessment are given. Feedback induced variations of lasing spectra and of mode partition noise and their influences on bit error rate (BER) data are experimentally determined for a dispersive single-mode fiber transmission link with the two coupling arrangements. Comparative measurements were done with a butt-coupled fiber and with a non-dispersive fiber system. Furthermore, far-end reflections from a connector joint and their quantitative influence on BER data were investigated. Author

PERFORMANCE OF INTEGRATED OPTICAL FREQUENCY SHIFTERS PIGTAILED TO HIGH BIREFRINGENCE FIBRES USING ION-MILLED GROOVES
I. Andonovic, W. Johnstone, D. N. Macfadyen, A. McDonach, M. S. Ner, and S. Beaumont *In* AGARD Guided Optical Structures in the Military Environment May 1986 8 p Prepared in cooperation with Glasgow Univ., Scotland (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The practical application of lithium niobate integrated optical devices in the severe military environmants that will be experienced by the fiber optic gyroscope, requires the development of a cheap, efficient and robust means of interconnecting optical fibers and integrated optical chips. One technique for fiber to chip coupling is the use of ion-milled alignment grooves in the Lithium Niobate substrate to accurately locate the fiber end with the end of the waveguide. This technique uses a photolithographic process for the most precise alignment stages and is therefore amenable to mass production and automation. Efficient coupling of light was observed between optical fibers chemically etched to a diameter of about ten microns and waveguides formed by the indiffusion of titanium. The use of chemically etched optical fibers and ion-milled grooves allows a high packing density of chip/fiber connections, offereing space saving in terms of device lengths as well as lateral separation. Results are presented for the coupling of light to integrated optical waveguides from high birefringence optical fibers using ion-milled alignment grooves, and the degree of polarisation preservation achieved is related to the performance of integrated optical phase modulators. INTEGRATED OPTICS OPTICAL LIMITERS
C. T. Seaton, J. D. Valera, and G. I. Stegeman *In* AGARD Guided Optical Structures in the Military Environment May 1986 7 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Two novel, low-power, guided-wave optical limiters were demonstrated. Both are based on intensity-dependent refractive indices and involve phenomena unique to optical waveguides. The first utilizes newly discovered nonlinear guided waves that exhibit optical-limiting action for a film bounded by a nonlinear medium. The second relies on an intensity-dependent reduction in coupling efficiency when waveguide modes are excited by prism or grating couplers. In both cases, preliminary experiments have demonstrated optical limiting action. Author

PIN-FET PREAMPLIFIER FOR HIGH-SPEED OPTICAL TRANSMISSION SYSTEMS
B. Schwaderer *In* AGARD Guided Optical Structures in the Military Environment May 1986 6 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The design of a hybrid integrated PIN-FET transimpedance preamplifier is given for long-haul optical transmission systems at 1.3 micrometers wavelength with bit rates of 140 Mbit/s and 565 Mbit/s. The preamplifier uses a GaInAs/InP PIN-photodiode with a dark current of less than 10 nA, a high spectral responsivity of greater than 0.7 A/W at 5V bias supply and a GaAs-MESFET with 45 mS transconductance and about 0.7 pF input capacitance. Using transimpedance-resistors of 50 kilo-ohm and 25 kilo-ohm the design goals of receiver sensitivities are -43 dBm for the 140 Mbit/s system and -36.7 dBm for the 565 Mbit/s system respectively for BER equal to or less than 10(-9). The measured values of - 42.8 dBm and - 35.8 dBm including connector losses are within the predicted ranges. Author

OPTOELECTRONIC BROADBAND SWITCHING FOR COMMUNICATIONS AND SIGNAL PROCESSING c32
R. I. MacDonald and D. K. W. Lam *In* AGARD Guided Optical Structures in the Military Environment May 1986 10 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

By employing a hybrid technology using electronic and optical integration, optical isolation levels can be attained in a switch matrix without the need to switch light. Bandwidths of several GHz, subnanosecond switching time and crosstalk below 50 dB were demonstated in monolithically integrated optoelectronic switch matrices. These devices show high promise as central switches in star configuration communication systems where very high bandwidth or very large array size is required. Advantages over foreseeable alternative technologies include size and power consumption as well as performance. In addition, optoelectronic switch matrices have unique properties that suggest their application in a number of signal processing situations where precise broadband signal delays are required, such as in the phasing of arrays, or the production of tunable filters. Recent work in these areas are described. Author

Danh C. Tran *In* AGARD Guided Optical Structures in the Military Environment May 1986 6 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

In present silica fiber technology, optical attenuation at the intrinsic minimum level of about 0.15 dB/km at 1.6 micrometer has been attained. Non-oxide glasses based on heavy metal fluorides potentially can offer intrinsic minimum losses several orders of magnitude lower than that of silica, owing to a lower Rayleigh scattering loss contribution and an extended infrared absorption edge. As a result, heavy metal fluoride glasses are most promising for long distance repeaterless optical communication heavy metal fluoride glasses are most promising for long distance repeaterless optical comunication systems. The published literature on fluoride glasses and fiber is studied to provide a complete review of the present state-of-the-art in the field. Candidate fluoride glasses for fiberization are evaluated on the basis of their infrared transparency as well as their glass forming ability. The synthesis of high optical quality bulk fluoride glasses by conventional casting and the fabrication of fibers using both preform and crucible techniques are discussed. The optical properties of the fluoride glass fiber are evaluated based on the absorption loss contribution associated with hydroxyl groups and transition metal/rare-earth impurities, and on the scattering loss component arising from both Rayleigh scattering and processing induced defects such as microcrystallization, phase separation and particle inclusions. GLASS FIBRES FOR TRANSMISSION IN THE 8-12 MICROMETERS WAVEBAND
N. J. Pitt and M. G. Scott *In* AGARD Guided Optical Structures in the Military Environment May 1986 8 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Chalcogenide glasses, crystalline halides and hollow waveguides were assessed for transmission in the 8 to 12 micrometer waveband. Of these, chalcogenide glasses were selected for development of fiber optic materials. The bulk properties of a range of glasses were studied and compositions chosen to optimize transmission and thermal stability. The role of major impurities and the procedures used to minimise them are described. Selected compositions were drawn into long lengths of polymer coated fiber with diameters controlled accurately up to 500 micrometers. Current fibers transmit at CO2 laser wavelengths with losses of 5 to 10 dB/m but potential for substantial improvement still exists. Mechanical testing has shown that with suitable coatings chalcogenide fibers are flexible enough to sustain a bend radius of the order of 1 cm. Author

SINGLE CRYSTAL FIBERS
Robert S. Feigelson *In* AGARD Guided Optical Structures in the Military Environment May 1986 9 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Single crystal fibers are just now emerging as a new frontier in both materials science and device technology. Various methods have already been developed for the preparation of single crystal fibers of a wide range of materials with useful properties. Along with discussions of fiber growth methods and potential applications for single crystal fibers, current research on the growth of laser, nonlinear optic, and IR transmitting single crystal fibers are also discussed. FLUORIDE GLASSES FOR INFRARED WAVEGUIDES [VERRES FLUORES POUR GUIDES D'ONDE INFRA ROUGE]
J. Lucas *In* AGARD Guided Optical Structures in the Military Environment May 1986 7 p In FRENCH (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The realization of optical waveguides is more promising beginning with materials in the glassy state than to begin with polycrystalline or monocrystalline materials. At the present time, the glasses which correspond to the best compromise between the bandwidth of transmission, the ultra-transparence potential, low diffusion loss, and fiber preparation techniques are the fluoride glasses. The tetrafluoride glasses with a zirconium base permits transmission through fiber of up to 4 microns, those with a base of the heavy metals (thorium, indium, rare earths, etc.) up to 5 microns. The potential applications in long distance telecommunications (considering very low theoretical losses, 10(-3) dB/km) are discussed as well as short distance applications involving collection technologies and energy transport. WIDE BANDWIDTH, LONG DISTANCE FIBRE-OPTIC COMMUNICATION SYSTEMS
S. D. Walker, L. C. Blank, and L. Bickers *In* AGARD Guided Optical Structures in the Military Environment May 1986 9 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

Recent advances in laser, fiber and receiver technology have allowed a series of unrepeated optical transmission system experiments to be carried out. These spans ranged from 90 km to 250 km at line-rates from 34 Mbit/s to 2 Gbit/s. At data-rates of 34 Mbit/s and 140 Mbit/s, a single-line 1.525 micrometers distributed feedback laser was used in conjunction with step-index monomode fiber spans up to 251.6 km. In a second set of experiments, a 1.55 micron multi-longitudinal-mode laser gave error-free transmission over lengths of dispersion-shifted fiber up to 233 km. For gigabit transmission experiments, a 1.535 micron single-line laser and dispersion-shifted fiber provided a further system option which resulted in a recent fully-regenerated 2 Gbit/s, 90 km trial featuring commercially-available GaAs logic components. The various system configurations implemented are described and the technical options for further long-span, unrepeatered optical transmission experiments using current and developmental direct-detection technology in the 1.5 micron wavelength region are reviewed. PERFORMANCE OF RF FIBER OPTIC LINKS
Thomas R. Joseph and William E. Stephens *In* AGARD Guided Optical Structures in the Military Environment May 1986 12 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

RF fiber optic links have numerous applications to microwave systems. To fully exploit their usefulness, the RF system designer must understand their properties in terms of the performance parameters that are used to describe the terminal properties of other RF components such as loss, signal to noise, linearity, and dynamics. The performance of direct and external modulation fiber optic links in terms of those parameters are explained. Specific examples of a 4.1 to 4.7 GHz direct modulation link and a 2.0 to 12.0 GHz external modulation link are used. Author

FIBER OPTICS: A SURVIVABLE AND COST-EFFECTIVE TRANSMISSION MEDIUM FOR TERRESTRIAL NETWORKS
M. Aslam *In* AGARD Guided Optical Structures in the Military Environment May 1986 10 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The performance of a fiber-optic transmission system is

affected by nuclear radiation. The nuclear scenario is discussed vis the terrestrial network, the essential characteristics are identified, and on this basis the principles for the design of a strategic communication fiber-optic cable system are derived. The details of a cost analysis applicable to various scenarios are also given; the costs of each scenario are compared with those of a microwave line-of-site system of approximately the same capacity. SINGLE-MODE-FIBERS FOR FIBEROPTIC-GUIDED MISSILES: A COMPARISON WITH GRADED-INDEX MULTIMODE FIBERS
K. H. Niederhofer and W. D. Schuck *In* AGARD Guided Optical Structures in the Military Environment May 1986 8 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

For a few years there have been activities in the application of optical fibers as a broadband, secure transmission medium between a ground-station and tactical missiles for ranges of about 10 km. The idea is to put the gunner's eye, i.e., a suitable imaging device, into the missile to provide a lock-on-after-launch capability together with a man-in-the-loop option. A key problem is the rapid payout of the fiber from the missile during flight. Several successful flight test campaigns have been carried out, where Kevlar-reinforced graded-index multimode fibers have been used for transmission of command- and TV-signals. The affects of additional attenuation resulting from the reinforcement, the bobbin-technology and payout process are well controlled. For the first development of fiberoptic guidance systems single-mode transmission was not taken into account, since the suitable components were expensive, sensible and not readily available. Today the single-mode technology is quite advanced and offers some benefits compared with multimode transmission. The most important points are the higher bandwidth and the lower attenuation. As long as the missile range is below 10 km, this is no decisive advantage, but it encourages the extension of the missile range to much more than 10 km. The comparison of costs gives no clear-cut statement, but the production costs for single-mode fibers tend to be below that of multimode fibers. If the hardness against nuclear radiation is compared, single-mode fibers give the better results. Author

TACTICAL FIBER OPTIC ASSEMBLY REQUIREMENTS
Vasilios E. Kalomiris *In* AGARD Guided Optical Structures in the military Environment May 1986 9 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The unique features of militarized fiber optic assemblies are outlined. The stringent requirements that make tactical deployment a challenge to the fiber optic industry are summarized. The requirements are broken down to the component level: fiber, cable and connector. These demands on components are necessary to assure successful system operation. The compilation of specifications is presented in tabular form to serve as a reference for those interested in satisfying a host of ground systems needs. The significance of the performance of the cable assembly in the performance of the optical subsystem is also described. In addition, the requirements that the transceivers have to meet are reported and a comparison of the tactical and fixed plant is presented. E.R.

A HYBRID TRANSMISSION SCHEME ON SINGLE MODE FIBERS FOR TACTICAL COMMUNICATIONS
Steven S. Cheng *In* AGARD Guided Optical Structures in the Military Environment May 1986 6 p (For primary document see N87-13273 04-74)
Avail: NTIS HC A14/MF A01

The availability of single-mode fibers and long wavelength devices enables the system designers to consider new link design with much improved performance not presently available in either the multimode fiber or the traditional metallic conductor systems. A hybrid transmission scheme is proposed on single-mode fibers in a star configuration. At the command post, a primary laser and its standby laser running at the cw mode are followed by an optical splitter. Each output port is then externally modulated for downstream transmission. At each remote site, a dedicated LED is used for upstream transmission where the bandwidth requirement and therefore the dispersion penalty is generally lower. The cost, reliability and flexibility of this hybrid transmission scheme are examined. The use of bidirectional WDM devices and remote external modulators with polarization control is described as two potential variations to enhance this basic hybrid scheme. The deployment of such a system will provide cost effective transmission links in a tactical environment suitable for high bandwidth analog and digital transmission. Author

FLUIDS IN CONTACT WITH A HARD SURFACE: UNIVERSITY OF THE BRIDGE FUNCTIONS FOR THE DENSITY PROFILE
Y. Rosenfeld and L. Blum 27 May 1986 32 p (Contract N00014-81-C-0776)
(AD-A168945; AD-E500768; TR-22) Avail: NTIS HC A03/MF A01 CSCL 20/9

The modified hypernetted chain theory (MHNC) for density profiles of fluids in contact with a hard, smooth surface is found to possess a remarkably simple and interesting property: The accuracy of the MHNC and the universality of the bridge functions for the density profiles can be tested without resort to any detailed solution of the integral equations. It is given by the degree of universality of the bulk bridge parameter when expressed in terms of the second partial derivative of the free energy with respect to a certain density equation. This function (F) as obtained from MHNC calculations for bulk simple fluids is found to be remarkably

independent of the pair potential. As an example for the accuracy of the resulting method, the one component plasma near a hard wall is discussed. Author (GRA)

(DE86-012382; LA-UR-86-1952; CONF-860665-6) Avail: NTIS HC A02/MF A01

The plasma wakefield accelerator (PWFA) is an accelerator concept based on utilizing a large amplitude plasma wave to accelerate relativistic electrons to ultra-high energy. The plasma wave represents the wave produced by a relativistic beam as it passes through a cold plasma. As the beam enters the plasma its space charge polarizes the background. When the beam has passes the plasma is left with a large oscillating induced charge. The wakefields are derived assuming that the charge and current profiles of the driving bunch remain fixed. An estimate is made of the condition necessary for maintaining the profile of the driving bunch. The current required to result in an accelerating field approaching the wavebreaking limit is estimated. The beam dynamics for a small beam are simulated based on these estimates. The results of the studies reported indicate that the self-consistent transverse motion of the driving bunch makes pulse tailoring impossible to maintain. DOE

COMPARISON OF 2D MEMORY SEU TRANSPORT SIMULATION WITH EXPERIMENTS
R. Koga and W. A. Kolasinski 1 Sep. 1986 27 p
(ATR-86(8139)-2) Avail: NTIS HC A03/MF A01

Single event upset (SEU) simulations in SRAM were performed, and the results are compared to experimental data on 16K bit memories. The simulations consisted of simultaneous calculations of charge transport and transient circuit response for four cross-coupled CMOS transistors following the introduction of a slab of excess carries into the off p-channel drain. The experiments collected upset rates produced in the memories by 163 MeV argon ions directed normally to the chip surface. Agreement between experiment and calculation was achieved when the p-channel transistors were integrated into a single block of silicon as in the memory cell layout and scaling was done on the Auger coefficients to compensate for an inherent 2D effect. QUARTZ GROWTH ON X-SEEDS Patent
Alton F. Armington and John J. Larkin, inventors (to Air Force) Issued 18 Mar. 1986 5 p Supersedes AD-D011031
(AD-D012269; US-Patent-4,576,808; US-Patent-Appl-SN-566130; US-Patent-Class-423-335) Avail: NTIS Avail: US Patent and Trademark Office CSCL 20/2

According to the present invention, dislocation-free quartz crystal boules, which are especially valuable for use in frequency and timing device applications, can be produced by utilizing a seed crystal cut or sliced from the X-plus region of a synthetically grown quartz boule. The seed crystal takes the form of a rectangular prism shaped slab or plate with its length directed along the crystallographic Y-axis orientation, its width directed along the X-axis orientation, its width directed along the X-axis orientation, and its thickness in the Z-axis orientation. Accordingly, the primary object of this invention is to provide synthetic quartz seed crystals for use in growing substantially dislocation-free quartz crystal boules

for use in timing and frequency devices. Another object of this invention is to greatly reduce the number of dislocations and other defects in synthetic quartz grown for oscillator applications. Still another object of this invention is to provide Z-faced quartz seed crystals cut or sliced from the X-plus growing region of a quartx crystal boule. GRA

PLASMA-ENHANCED DEPOSITION AND PROCESSING OF TRANSITION METALS AND TRANSITION METAL SILICIDES FOR VLSI Final Report, 1 Feb. 1983 - 31 Jan. 1986
Dennis W. Hess 20 May 1986 16 p
(Contract DAAG29-83-K-0039)
(AD-A168963; ARO-19996.9-MS) Avail: NTIS HC A02/MF A01 CSCL 20/12

Radiofrequency (rf) discharges have been used to deposit films of tungsten, molybdenum and titanium silicide. As-deposited tungsten films, from tungsten hexafluoride and hydrogen source gases, were metastable (beta W), with significant (>1 atomic percent) fluorine incorporation. Film resistivities were 40-55 micro ohm - cm due to the beta W, but dropped to about 8 micro ohm cm after a short heat treatment at 700 C which resulted in a phase transition to alpha W (bcc form). The high resistivity (>10,000 micro ohm) associated with molybdenum films deposited from molybdenum hexafluoride and hydrogen appeared to be a result of the formation of molybdenum trifluoride in the deposited material. Titanium silicide films formed from a discharge of titanium tetrachloride, silane, and hydrogen, displayed resistivities of about 150 micro ohm cm, due to small amounts of oxygen and chlorine incorporated during deposition. Plasma etching studies of tungsten films with fluorine containing gases suggest that the etchant species for tungsten in these discharges are fluorine atoms. GRA

INCREMENTAL QUENCH RESEARCH
L. Colombo and A. J. Syllaios 30 May 1986 50 p
(Contract DAAG29-85-C-0005)
(AD-A168960; TI-U1-134375-F; ARO-22602.1-MS-A) Avail: NTIS HC A03/MF A01 CSCL 20/2

The growth of large homogeneous (Hg,Cd)Te single crystals by the incremental quenching process/traveling heater method was investigated. The method is based on the sequential freezing of shallow melts that have large surface-to-volume ratios onto a large diameter growing ingot. The resulting polycrystalline (Hg,Dd) Te ingot has a bimodal microstructure with small grains on the outer surface and dendrides at the center of the ingot. Subsequent annealing of the ingots at a temperature below the solidus promotes grain growth on the order of 25 mm in diameter. Crowth of large area crystals by the traveling heater method has been successfully demonstrated where 22- by 40-mm crystals have been grown without a seed. The crystals show very low subgrain boundary structures with dislocation densities ranging from 50,000 per sq cm to 300,000 per sq cm as measured by the etch pit method. The electrical characteristics of smaller crystals (20 mm in diameter) grown by the traveling heater method have shown purification during growth. GRA

MICROWAVE LOSS PROPERTIES OF HEXAGONAL FERRITES FOR MILLIMETER WAVE APPLICATIONS Final Report, 15 Aug. 1984 - 14 Feb. 1986
Carl E. Patton 15 Mar. 1986 13 p
(Contract DAAG29-84-K-0172)
(AD-A168982; ARO-21210.2-MS) Avail: NTIS HC A02/MF A01 CSCL 20/2

This short term post LRCP contract was designed to explore the application of the off-resonance effective linewidth technique to hexagonal ferrite materials at X-band frequencies. This objective has been accomplished. It has been demonstrated that the technique works quite well for both uniaxial and planar ferrite materials. The key result for millimeter wave applications is that a significant part of the microwave losses in these materials appears to be related to inhomogeneities. The effective losses which would determine insertion loss parameters for off-resonance device applications would appear to be much lower than one would infer from a direct ferromagnetic resonance linewidth determination. It was also possible to use the technique to measure the off-resonance loss properties in uniaxial materials at X-band, even though the large anisotropy fields precluded the observation of the FMR peak. The application of the technique to planar samples has also led to a new approach to the analysis of fundamental microwave relaxation processes in ferrite materials. GRA

SEARCH FOR FAR INFRARED RADIATION FROM OPTICALLY AND ACOUSTICALLY PUMPED DEFECT MODES Final Report, 14 Feb. 1983 - 13 Feb. 1986
A. J. Sievers 15 Apr. 1986 54 p
(Contract DAAG29-83-K-0044)
(AD-A169159; ARO-19793.4-PH) Avail: NTIS HC A04/MF A01 CSCL 20/5

More than one elastic ground state configuration has been found for both monatomic and polyatomic defects matrix isolated in alkali halide crystals. Multiple ground states give rise to persistent changes in the vibrational absorption spectrum of molecules when the internal vibrational modes of the defect are excited with a high resolution but tunable IR laser. The end result is that spectral holes with a width characteristic of the dephasing time of the vibrational mode can be created in the inhomogeneously strain broadened spectrum. The technique has been used to identify CN-:Na+, a new kind of vibrational defect which hole burns and also shows vibrational fluorescence in the IR. The discovery of the first solid state IR vibrational laser was a direct consequence of these kinds of measurements. The observations of transient and persistent hole burning, of vibrational fluorescence and of vibrational laser radiation demonstrate that diatomic molecules are more weakly coupled to the lattice than are polyatomics. STUDY TO DETERMINE THE FEASIBILITY OF UTILIZING SKULL-MELTING TECHNIQUES FOR THE GROWTH OF SINGLE CRYSTALS OF YTTRIUM VANADATE Final Report, 15 Sep. 1982 - 14 Sep. 1984
Joseph F. Wenckus and Wilson P. Menashi 1 Apr. 1986 32 p
(Contract DAAG29-81-C-0035)
(AD-A169249; ARO-18492.1-PH-S) Avail: NTIS HC A03/MF A01 CSCL 20/2

The goal of this program is to explore the feasibility of utilizing RF induction heated skull-melting techniques for the growth of optical quality crystals of yttrium vanadate (YVO4). In a parallel effort, experiments were also carried out to explore the fusion and recrystallization of yttrium aluminum garnet (YAG) in a cold crucible. Yttrium vanadate melts were achieved in cold crucibles up to 157 mm in diameter operating at an RF frequency of 3 MHz. However, attempts to Czochralski crystal growth were not successful due to poor thermal geometry and dissociation of the skull-contained melt. Experiments suggest that oxygen overpressures in excess of 2 atmos. may be useful in suppressing the dissociation rate of YVO4 melts. Skull-melting of YAG was achieved using an RF frequency of 3 MHz (no melting was observed at lower frequencies). However, the melts tended to slowly de-couple and freeze spontaneously; stable melts could not be maintained for periods beyond 2-3 hours. GRA

RAPID SYNTHESIS OF INDIUM PHOSPHIDE Patent Application
J. A. Adamski, inventor (to Air Force) Filed 25 Nov. 1985 23 p
(AD-D012362; US-Patent-Appl-SN-801348) Avail: NTIS HC A02/MF A01 CSCL 20/12

This invention relates to an improved method for fabricating a highly pure, crystalline semiconductor material having stoichiometric proportions. More particularly, this invention concerns itself with an improved method for producing highly pure, stoichiometric indium phosphide crystalline materials (which are especially useful as substrates for epitaxy procedures) in a rapid manner as compared with past procedures. Indium phosphide, a group III-V semiconductor compound, has been found to be especially useful in two areas of technical interest. Its large band gap (1.35 eV) and high electron mobility make it useful as a semiconductor material, especially when employed in its highly pure form, and as a crystalline substrate for device fabrication by epitaxial deposition techniques. This abstract discloses a process for the high pressure synthesis of InP using an independent temperature control of a three zone furnace incorporating a heat pipe provides a stable temperature profile throughout the synthesis cycle. Internal/external pressure control of the quartz ampoule is maintained by use of a water cooled baffle and a temperature/pressure balancing program. Complete synthesis is achieved in less than five hours. GRA

SPHERICAL CLUSTERS OF SIMPLE METALS: MADELUNG ENERGIES AND STRUCTURE
M. Manninen Jun. 1986 14 p
(Contract N00014-82-K-0576)
(AD-A169560; TR-24) Avail: NTIS HC A02/MF A01 CSCL 20/12

Recent experiments on the magic numbers of small sodium clusters suggest that variation of the binding energy of clusters as a function of their size is dominated by the filling of energy levels of electrons moving in a spherical potential. For large clusters it is expected that the electron density distribution starts to be more and more spherical as the cluster increases. The purpose of this communication is to show that if the electron density distribution is assumed to be spherically symmetric, the resulting ionic configuration is determined mainly due to a classical Madelung energy. Furthermore it is shown that the ground state structures of the clusters are generally not small pieces of simple lattices (bcc, fcc, or hcp), but take always a more spherical shape (e.g., icosahedral in the case of a 13 atom cluster). The variation of the structural energy as a function of the cluster size is found to be somewhat smaller than the variation arising from the filling of single electron energy shells giving support to the idea that the dominant magic numbers are determined by the electronic shell structure of a square well potential. Contents of this report include Conversion of Our Programs to CRAY Vector Supercomputers; Calculations for Cationic Polymerization of Energetic Monomers; MRD-CI Calculations on Decomposition Pathways of Energetic Nitrocompounds; POLY-CRYST; Ab-Initio Atom Class - Atom Class Potential Functions and Prediction of Crystal Densities. In anticipation of significant access to the NRL CRAY XMP-12 supercomputer we devoted major attention this past year to converting our programs to that computer, which runs under a COS operating systems. As a preliminary to carrying out MRD-CI calculations on the attack of oxetane on protonated oxetane in the propagation step of cationic polymerization, we initiated MRD-CI calculations on opening the oxetane ring and the protonated oxetane ring. We carried out MRD-CI calculations for the dissociation of the >C-NO2 bond in nitrobenzene. We continued testing of our POLY-CRYST program for ab-initio calculations in crystals and polymers. We also implemented further additions to the INTER-MOLASYS program including the capability of calculating the dispersion energy contributions by a variation-perturbation procedure. We have also calculated further ab-initio atom class-atom class potential functions. GRA

DONOR-ACCEPTOR ONE STEP ENERGY TRANSFER VIA EXCHANGE COUPLING ON A FRACTAL LATTICE Interim Technical Report
C. L. Yang and M. A. El-Sayed 7 Jul. 1986 29 p
(Contract N00014-83-K-0341)
(AD-A169843; TR-48) Avail: NTIS HC A03/MF A01 CSCL 20/12

Temporal behavior of donor intensity, I sub D (t), resulting from one step donor-acceptor electronic excitation energy transfer process via exchange mechanism is calculated on fractal lattices, with discrete dilation symmetry, of Euclidean dimension, d = 2, and fractal dimension, D, ranging from 1.99 to 1.0. I sub D (t) is fitted to the approximate equation of Klafter-Blumen (K-B) which is useful in fitting experimental results to determine fractal dimension from the slope of the expected straight line obtained by plotting in(-in I sub d (t)), vs. in 1 sub D t). The result for fractal lattice with D = 1.99 indicates that the approximation is appropriate for the time range used in our calculations. The results for different fractal lattices also show that the K-B equation indeed gives a straight line for structure when D/d is not much smaller than unity. As this ratio decreases, deviation from the expected straight line results and an oscillatory behavior is observed. From the latter structural information (i.e., fractal dimensionality, and geometrical parameters characterizing the fractal lattices) as well as the molecular interaction parameter gamma, the distance dependence of the exchange interaction can be determined. Geoscience is under contract to the U.S. Army to measure thermophysical properties of two semiconductor materials, cadmium telluride and gallium arsenides. The specific properties to be determined are coefficient of linear thermal expansion, specific heat, grey body emissivity, and thermal conductivity. During this study, Geoscience developed a new method of making infrared emissivity measurements at higher temperatures with no particular limitations. This final report summarizes the results of emissivity and coefficient of thermal expansion measurements made for both cadmium telluride and gallium arsenide. GRA

Strontium Barium Biobates:60 doped with Ce and Fe crystals have now been grown with improved optical quality using the Czochralski technique. The liquid phase epitaxial (LPE) growth of SBN:46 on SBN:60 substrate has also been successfully demonstrated, with particularly good results for (100) and (110) film orientations. The recent photorefractive measurements on Ce doped SBN:60 crystals show that the Tungsten Bronze, SBN:60 crystals are superior in many respects to BaTi03 because of enhanced two beam coupling coefficients, sensitivity and the overall flexibility of tungsten bronze crystals. La3+-doped SBN:50 single crystals have also been grown for pyroelectric detector studies and it was found that the growth of doped crystals is possible. Crystals as large as 1 to 1.5 cm in diameter have been grown successfully. Current measurements show that this composition exhibits excellent pyroelectric and dielectric properties to use in longitudinal configuration; hence, work is in progress to use this composition for pyroelectric detector applications. The role of other cations such as calcium and yttrium has also been studied and they appear to be promising for the proposed device applications. GRA

The Topical Meeting on Microphysics of Surfaces, Beams, and Adsorbates was organized within the interdisciplinary area of molecule/surface interactions induced, or studied, by laser and ion beam techniques. Especially emphasized was the molecular physics and electromagnetism of beam activated chemical reactions for applications in fabrication of semiconductor devices, in photocatalysis, and in optical recording. Emphasis was on the laser spectroscopy of molecular collision and reaction processes on surfaces, new sensitive or high resolution spectroscopies for studies of adsorbates, and optical methods applied to surface characterization. KINETICS AND MECHANISMS ON THE MOLECULAR BEAM ETCHING OF SEMICONDUCTORS Final Report, 15 Aug. 1982 - 15 Feb. 1986
H. P. Gillis Jul. 1986 58 p
(Contract DAAG29-82-C-0020)
(AD-A171360; ARO-19068.1-EL) Avail: NTIS HC A04/MF A01 CSCL 13/8

The main issue addressed was the role of the ion beam in control of anisotropy and selectivity in the ion-beam assisted etching (IBAE) of layered samples of Si and SiO2, as are used in CMOS gate applications. The results on patterned samples were correlated directly with the geometrical relationship of the incident beams and the sample. Rate data were obtained which suggest that the reaction proceeds by facilitated attack of reactant species at defect sites created by the ion beam. It was demonstrated that ion beam energy greater than 500 eV caused inadequate selectivity between Si and SiO2. It was shown that inadequate selectivity is the main problem holding back implementation of IBAE as a practical process. It is suggested that additional work in the direction of low energy IBAE (50-500 eV) be pursued. GRA

QUANTUM 1/F NOISE IN SOLID STATE DOUBLE DEVICES, IN PARTICULAR Hg(1-x)CdxTe DIODES Final Report, 16 Sep. 1985 - 15 Mar. 1986
A. vanderZiel 22 May 1986 33 p
(Contract DAAG29-85-K-0235)
(AD-A171438; ARO-22874.1-EL) Avail: NTIS HC A03/MF A01 CSCL 20/10

It is shown how one can discriminate between two modes of diffusion 1/f noise fluctuations in p-n diodes: (1) all minority carriers contribute to the noise; (2) only the excess minority carriers contribute to the noise. The n(+)-p Hg(1-x)Cd(x)Te diodes seem to follow case (1) at back bias. For forward biased diodes S sub I(f)/I-sq is independent of bias, as expected for surface recombination in the p-region. P+-i-n Si diodes seem to follow case (2) at first sight, but this would be an erroneous conclusion, since in these diodes the noise is caused by recombination in the space charge region. The experiments give Si(f)/(abs. vol. I) = constant, as expected for recombination 1/f noise. In Hg1-xCdxTe the carrier lifetime has not yet been established, and hence the alpha sub H/tau data cannot be used to evaluate alpha sub H. It seems reasonable, however, that for x = 0.30 the estimated value of alpha sub H lies between the coherent state value .0046 and the incoherent state value .00005 depending on the value of tau. More accurate determination of tau (both theoretical and experimental) are being planned. GRA

EPITAXIAL CRYSTALLIZATION AND EPITAXIAL POLYMERIZATION AS TOOLS FOR MOLECULAR ENGINEERING Final Report, 1 Sep. 1983 - 31 Aug. 1986
Jerome B. Lando and Scott E. Rickert 30 Jul. 1986 15 p
(Contract DAAG29-83-K-0130)
(AD-A171506; ARO-20280.1-CH) Avail: NTIS HC A02/MF A01 CSCL 20/12

A study has been made of the use of epitaxial crystallization of polymers, epitaxial polymerization and combinations of surface interactions and reactions to produce polymer epilayers with unique structures, morphologies, and properties. Classically, epitaxial crystallization of polymers is the oriented crystallization of polymers during interaction with a crystalline substrate. Epitaxial polymerization involves the crystallization of a monomer on a crystalline substrate and subsequent polymerization initiated thermally by ionizing radiation or by chemical doping. In addition, a technique termed graphoepitaxy has been utilized which results from crystallization along deliberate deformities or topologies such as grooves in the substrate surface, and not necessarily crystallographic interactions. ENERGETICS OF DISLOCATION RELAXATION ASSOCIATED WITH CLEAVAGE IN Cd-DOPED ZINC CRYSTALS AS PROBED BY SYCHROTRON TOPOGRAPHY
H. A. Schmitz, J. C. Bilello, and Z. Rek (Stanford Univ., Calif.) 1986 38 p Presented at the International Conference on Low-Energy Dislocation Structures, Charlottesville, Va., 10 Aug. 1986 Prepared in cooperation with Stanford Univ., CA.
(Contract DE-FG02-84ER-45098)
(DE86-002968; DOE/ER-45098/11; CONF-860809-1) Avail: NTIS HC A03/MF A01

An almost ten-fold increase in the cleavage energy of 0.1% Cd-doped zinc crystals has been previously reported in the literature and attributed to an increase in the intrinsic surface energy. The energetics of the cleavage process as a function of dopant concentration over the range 0.01, 0.03, 0.06 and 0.13% Cd has been systematically measured and correlated with the observed dislocation microstructure induced by crack initiation and growth. The dislocation relaxation zones were determined by nondestructive observations using synchrotron radiation topography. Since the primary cleavage and slip systems are co-planar, previous workers have ignored plastic relaxation and assumed fracture had to proceed in a purely brittle fashion. Synchrotron topography results indicated extensive plastic relaxation at the crack tip and also downstream during crack propagation. Based on these observations a modified Griffith analysis could be used to determine the relative contributions to the cleavage energy due to the intrinsic surface and dislocation relaxation processes. It was concluded that the latter process is the dominant factor in controlling the fracture toughness of these alloys. DOE

ELECTRON DIFFRACTION ANALYSIS OF THE PENTAGONAL ARRANGEMENT OF GRAINS FOUND IN CVD PURE Ni FILMS
A. N. Campbell, M. J. Carr, and J. B. VanderSande (Massachusetts Inst. of Tech., Cambridge.) 1986 3 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986 Prepared in cooperation with Massachusetts Inst. of Tech., Cambridge.
(Contract DE-AC04-76DP-00789)
(DE86-009023; SAND-86-0567C; CONF-860829-16) Avail: NTIS HC A02/MF A01

The structure of each crystal in the pentagon is fcc, as verified by diffraction patterns from individual grains. It is suggested that the large pentagonal regions observed were nucleated by small decahedral clusters of Ni atoms during the early stages of the deposition. However, for grains as large as those shown the body centered orthorhombic structure is not stable; at some point during the growth process the crystal structure reverted to the energetically preferred fcc. The relative orientation between the individual crystals, having been established by the decahedral nucleus, was preserved during growth. The 7.5 deg. mismatch was taken up evenly around the pentagon by the formation of dislocations and/or secondary twins at the boundaries. DOE

IN-SITU INTERDIFFUSION MEASUREMENTS IN HgTe-CdTe SUPERLATTICES
J. L. Staudenmann, R. D. Horning, R. D. Knox, J. Reno, I. K. Sou, J. P. Faurie, and D. K. Arch 1986 17 p Presented at the Northeast Regional Meeting on Semiconductor-based Heterostructure Interfacial Structure and Stability, Murray Hill, N.J., 1 May 1986
(Contract W-7405-eng-82)
(DE86-011429; IS-M-576; CONF-8605111-2) Avail: NTIS HC A02/MF A01

HgTe-CdTe superlattices have been proposed as a tunable narrow bandgap semiconductor (E sub g approx. 0.1 to 0.16 eV) having potential applications in the long wavelength infrared region. The usefulness of such narrow band gap optical material relies on the stability of the constitutent Hg, Cd, and Te atoms across the heterointerfaces of the superlattice structure (interdiffusion). Temperature dependent in-situ x-ray diffraction measurements have been carried out on several HgTe-CdTe samples to determine the extent of interdiffusion of the Hg, Cd, and Te atoms in the superlattice region. The estimated interdiffusion constants D(T) are based on the analysis of the x-ray satellite intensities as a function of time for given temperatures T. The results show that the diffused (1,1,1) HgTe-CdTe superlattices are intrinsically more stable than Hg(1-x)Cd(x)Te alloys: the superlattice diffusion constants are considerably lower than those for alloys. The results further show that, even at room temperature, the lifetime of such a HgTe-CdTe superlattice device is probably limited and that it also seems to depend upon the environment. DOE

STRUCTURAL FEATURES AT THE SI-SIO2 INTERFACE
K. L. Brower Jul. 1986 30 p Presented at the 4th International Symposium on Magnetic Resonance in Colloid and Interface Science, Munster, West Germany, 21 Jul. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012947; SAND-86-0787C; CONF-860748-1) Avail: NTIS HC A03/MF A01

Electron paramagnetic resonance studies of defects at the Si-SiO2 interface are presented which deal with the hyperfine interactions, strain effects, and spin-spin interactions. Our hyperfine studies include studies of the O-17 and Si-29 hyperfine interactions associated with dangling bonds localized on Si atoms at the (001)

and (111) Si-SiO2 interfaces. These studies indicate that oxygen is not an immediate part of the defect structure. Strain is manifested in the EPR spectra by Zeeman and hyperfine broadening effects from which we deduce that the rms deviation in the vertical position of the defect Si atoms is approximately 0.02 A. A computational model for calculating the dipolar contribution to the linewidth due to unpaired spins at the interface is presented. The contribution to the total linewidth of the P/sub b/ Zeeman resonance, which is 2.1 G (fwhm), is calculated to be 0.35 G for the case in which the applied magnetic field is perpendicular to the (111) Si-SiO2 interface. DOE

SURFACE GREEN FUNCTION MATCHING FOR A THREE-DIMENSIONAL NON-LOCAL CONTINUUM
J. O. A. Idiodi Jul. 1985 21 p
(DE86-702647; IC-85/125) Avail: NTIS (US Sales Only) HC A02/MF A01

With a view toward helping to bridge the gap, from the continuum side, between discrete and continuum models of crystalline, elastic solids, explicit results are presented for nonlocal stress tensors that describe exactly some lattice dynamical models that have been widley used in the literature for cubic lattices. The Surface Green Function Matching (SGFM) method, which has been used successfully for a variety of surface problems, is then extended, within a continuum approach, to a nonlocal continuum that models a three-dimensional discrete lattice. The practical use of the method is demonstrated by performing a fairly complete analytical study of the vibrational surface modes of the SSC semi-infinite medium. Some results are presented for the (100) direction of the (001) surface of the SCC lattice. DOE

SURFACE AND ADSORPTION-LIKE STATES WITHIN THE NEARLY FREE ELECTRON APPROXIMATION
L. Jurczyszyn Jul. 1985 11 p
(DE86-702651; IC-85/136) Avail: NTIS (US Sales Only) HC A02/MF A01

The energy properties of surface and absorption-like states were considered. In comparison with quasi-three-dimensional model which was presented earlier, the model described in this paper has pure three-dimensional character. Electronic states in fcc crystals were described using two-band model of the nearly free electron approximation. Absorbed atoms, treated as scattering centers were described by the small radium potential approximation. DOE

N87-13343# International Centre for Theoretical Physics, Trieste (Italy).
THEORY OF FRACTIONAL QUANTUM HALL EFFECT
I. Z. Kostadinov Aug. 1985 27 p
(DE86-702652; IC-85/141) Avail: NTIS (US Sales Only) HC A03/MF A01

A theory of the Fractional Quantum Hall Effect is constructed based on magnetic flux fractionization, which lead to instability of the system against selfcompression. A theorem is proved stating that arbitrary potentials fail to lift a specific degeneracy of the Landau level. For the case of 1/3 fractional filling a model 3-particles interaction is constructed breaking the symmetry. The rigid 3-particles wave function plays the role of order parameter. In a BCS type of theory the gap in the single particles spectrum is produced by the 3-particles interaction. The mean field critical behavior and critical parameters are determined as well as the Ginsburg-Landau equation coefficients. The Hall conductivity is calculated from the first principles and its temperature dependence is found. The simultaneous tunnelling of 3,5,7 etc. electrons and quantum interference effects are predicted. DOE

SUPERCONFORMAL TENSOR CALCULUS AND MATTER COUPLINGS IN SIX DIMENSIONS
E. Bergshoeff, E. Sezgin, and A. van Proeyen Jul. 1985 59 p Prepared in cooperation with Louvain Univ. (Belgium)
(DE86-702617; IC-85/112) Avail: NTIS (US Sales Only) HC A04/MF A01

Using superconformal tensor calculus we constructed general interactions of N=2, d=6 supergravity with a tensor multiplet and a number of scalar, vector, and linear multiplets. We start from the superconformal algebra which we realize on a 40 + 40 Weyl multiplet and on several matter multiplets. A special role is played by the tensor multiplet, which cannot be treated as an ordinary matter multiplet, but leads to a second 40 + 40 version of the Weyl multiplet. We also obtain a 48 + 48 off-shell formulation of Poincare supergravity coupled to a tensor multiplet. DOE

REGRESSION MODELS OF QUARTERLY OVERHEAD COSTS FOR SIX GOVERNMENT AEROSPACE CONTRACTORS M.S. Thesis
David J. Jerabek Mar. 1986 94 p
(AD-A169185) Avail: NTIS HC A05/MF A01 CSCL 14/1

Since overhead costs constitute a large percentage of total cost for aerospace contractors, it is important to be able to predict them accurately. The research performed in this thesis takes six government aerospace contractors and obtains regression models of their overhead costs that can be utilized for forecasting purposes. This method is preferable to some of the more commonly used methods because it estimates overhead costs directly, eliminating reliance upon predicted overhead rates. After the data were transformed to eliminate the effects of autocorrelation, excellent structural results were obtained for five of the six aerospace contractors. A Monte Carlo simulation was performed to compare various estimators of the autocorrelation. Two of the estimators were found to be superior. These two estimators are both two-stage estimators that are calculated utilizing Wallis's test statistic for fourth-order autocorrelation. Author (GRA)

(AD-A171366; AD-F250645; NPS-54-86-006) Avail: NTIS

HC A03/MF A01 CSCL 05/1

Although there are numerous problems associated with the management of Federal information systems, the usual solutions proposed for these problems have had and will have little, if any, effects. This paper examines the characteristics of Federal information systems and shows that most proposed solutions are directed at symptoms of the problems and not at their underlying causes. These solutions do not reflect the public sector nature of Federal information systems and hence, are either unrealistic or ineffectual. The authors do not propose another panacea. GRA

ELECTRONIC FORMS. HOW CLOSE TO VALUE-ADDED PROCESSING
J. R. Schofield, Jr. Apr. 1986 49 p Presented at the USDOE/Contracts Automated Office Support Systems (AOSS) Conference, Pittsburgh, Pa., 14 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-010484; SAND-86-1072C; CONF-8605126-1) Avail: NTIS HC A03/MF A01

The number of automated applications developed to support administrative activities continues to grow. While electronic mail and word processing are familiar office automation activities, other areas are under development consideration. One of the newer areas is electronic forms. The features that electronic forms need to employ, the challenges to electronic forms implementation and the integration with organizational data processing strategy are the subject of this paper. Purpose of this paper is to identify related issues for the reader. An electronic form is used in this paper to describe a system that captures, edits, routes, processes, tracks, secures and archives data electronically. The term form is used synonomously with electronic form. Paper forms are so identified. DOE

DATA TAGGING IN THE ENERGY DATA BASE
A. E. Ekkebus 1986 6 p Presented at the 14th Consultative Meeting of the INIS Liaison Officers, Washington, D.C., 5 May 1986
(Contract DE-AC05-84OR-21400)
(DE86-010621; CONF-8605125-1) Avail: NTIS HC A02/MF A01

The purpose of this study was to survey the use of data tagging in the Energy Data Base. INIS records are a subset of the Energy Data Base. The survey audience consisted of twelve heavy users of the Energy Data Base; primarily they are in the libraries of the national laboratories supported by the US Department of Energy. The libraries were contacted and told of this study. They were given an explanation of data tagging in late January and were requested to be aware of potential uses of data tagging during the study period that would extend until mid-March. At the end of the period, the libraries were contracted for their opinions about various aspects of data tagging. DOE

FURTHER RESULTS ON INTERPOLATION SEARCHING OF DATABASES
Z. J. Li and H. K.T. Wong Feb. 1986 25 p
(Contract DE-AC03-76SF-00098)
(DE86-012822; LBL-20708) Avail: NTIS HC A02/MF A01

Known results of the Interpolation Search Algorithm on ordered tables are extended in three ways. First, the effect of batching the search queries is examined. Second, the basically main-memory algorithm is applied to a more typical database environment, i.e., a blocked secondary memory. Third, a hybrid algorithm is examined to remedy the worst case behavior of the pure Interpolation Search in the event of non-uniform distribution of the ordered file while retaining the average complexity. Algorithms, analytic expressions and experiment results of these extensions are given and described. Analytic expressions of these algorithms are validated by the experiments. DOE

THE UNCOUNTED BENEFITS: FEDERAL EFFORTS IN DOMESTIC TECHNOLOGY TRANSFER
Richard L. Chapman and Kathryn Hirst Jul. 1986 366 p
(Contract NASw-3466)
(NASA-CR-177044; NAS 1.26:177044) Avail: NTIS HC A16/MF A01 CSCL 05A

Organized technology transfer activities conducted by the agencies of the U.S. government are described. The focus is upon agency or departmental level activity rather than the laboratory level. None of the programs on which information was collected has been assessed or evaluated individually. However, the aggregate programs of the government have been judged in terms of obvious gaps and opportunities for future improvement. An overview, descriptions of the various agency or department programs of technology transfer, a list of persons interviewed or consulted during the survey, and a bibliography of publications, reports and other material made available to the study staff are given. An extensive appendix of illustrative material collected from the various programs is also given. Author

INFRARED REFLECTION NEBULAE IN ORION MOLECULAR CLOUD 2
Yvonne Pendleton, M. W. Werner, R. Capps (Hawaii Univ., Honolulu.), and D. Lester (Texas Univ., Austin.) Jun. 1986 46 p
(NASA-TM-88259; A-86276; NAS 1.15:88259) Avail: NTIS HC A03/MF A01 CSCL 03A

New obervations of Orion Molecular Cloud-2 have been made from 1-100 microns using the NASA Infrared Telescope Facility and the Kuiper Airborne Observatory. An extensive program of polarimetry, photometry and spectrophotometry has shown that the extended emission regions associated with two of the previously known near infrared sources, IRS1 and IRS4, are infrared reflection nebulae, and that the compact sources IRS1 and IRS4 are the main luminosity sources in the cloud. The constraints from the far infrared observations and an analysis of the scattered light from the IRS1 nebula show that OMC-2/IRS1 can be characterized by L less than or equal to 500 Solar luminosities and T approx. 1000 K. The near infrared (1-5) micron albedo of the grains in the IRS1 nebula is greater than 0.08. Author

INVESTIGATIONS OF LONG-PERIOD DQ HERCULIS STAR Ph.D. Thesis
William Roy Penning 1986 190 p
Avail: Univ. Microfilms Order No. DA8613445

The magnetic rotator model has long been the favored explanation for coherent photometric modulations in the DQ Herculis class of cataclysmic variables. However, to date, all evidence supporting this model has been of the indirect variety. Unlike their synchronously rotating cousins, the AM Herculis objects, DQ Herculis stars have not yet been discovered to emit polarized radiation. Therefore, in light of this crucial lack, the evidence used to place these objects in the magnetic cataclysmic variable category has been strictly circumstantial, based primarily on the coherence of the photometric periodicities. For this work, time-resolved spectroscopy of four long-period DQ Herculis stars was performed. In addition, two of the same objects were observed with a new, sensitive circular polarimeter. Coherent variations in the wavelength of emission lines were found with the spectroscopic observations. A model is put forth, explaining this phenomenon as being due to varying illumination from a bright spot on the primary. This adds strength to the magnetic rotator model. Circular polarization was definitely found in one object studied, and possibly in a second. In a later chapter of the thesis, the model of the rotating bright spot illuminating the disk is explored in further detail, including modeling with a minicomputer. Afterward, a problem brought out by the low polarization coupled with large amplitude photometric variations and a cool spectrum is investigated, namely, whether it is possible to produce large amounts of cyclotron radiation without producing large amounts of circular polarization. Dissert. Abstr.

OBSERVATIONAL STUDY OF ION-ELECTRON EQUILIBRATION AND OF CLOUD EVAPORATION IN SUPERNOVA REMNANTS UNDER THE HEAO-2 GUEST INVESTIGATOR PROGRAM Final Project Report, 1 Jun. 1985 - 30 Sep. 1986

Richard G. Teske 30 Sep. 1986 11 p
(Grant NAG8-535)
(NASA-CR-179922; NAS 1.26:179922) Avail: NTIS
HC A02/MF A01 CSCL 03B

Observations of three selected supernovae remnants (Cygnus Loop, IC 443, and Puppis A) were made in the forbidden coronal iron lines (Fe X) lambda 6374 and (Fe XIV) lambda 5303. The resulting data was compared quantitatively with Einstein images of the same objects, and an attempt was made to determine (a) the process by which ion and electron energies are equilibrated behind the shock front in the ISM and (b) whether cloud evaporation occurs within the hot remnant interiors. Spatially-resolved X ray emission were modeled for Sedov-Taylor blast wave models of supernovae remnants (SNR) under conditions of non-equilibrium ionization. The computations are intended to provide results that can be directly compared with Einstein high resolution image (HRI) and imaging proportional counter (IPS) data. The computer program for predicting the spatial distribution of HRI and IPS counting rates was completed, and final testing of it had begun. E.R.

HIGH ENERGY NEUTRINO ABSORPTION AND ITS EFFECTS ON STARS IN CLOSE X-RAY BINARIES
T. K. Gaisser and F. W. Stecker Jul. 1986 21 p Submitted for publication
(NASA-TM-89269; NAS 1.15:89269) Avail: NTIS
HC A02/MF A01 CSCL 03B

The physics and astrophysics of high energy neutrino production and interactions in close X-ray binary systems are studied. These studies were stimulated by recent observations of ultrahigh energy gamma-rays and possibly other ultrahigh energy particles coming from the directions of Cygnus X-3 and other binary systems and possessing the periodicity characteristics of these systems. Systems in which a compact object, such as a neutron star, is a strong source of high energy particles which, in turn, produce photons, neutronos and other secondary particles by interactions in the atmosphere of the companion star were considered. The highest energy neutrinos are absorbed deep in the companion and the associated energy deposition may be large enough to effect its structure or lead to its ultimate disruption. This neutrino heating was evaluated, starting with a detailed numerical calculation of the hadronic cascade induced in the atmosphere of the companion star. For some theoretical models, the resulting energy deposition from neutrino absorption may be so great as to disrupt the companion star over an astronomically small timescale of the order of 10,000 years. Even if the energy deposition is smaller, it may still be high enough to alter the system substantially, perhaps leading to quenching of high energy signals from the source. Given the cosmic ray luminosities required to produce the observed gamma rays from cygnus X-3 and LMX X-4, such a situation may occur in these sources. E.R.

ON THE TWO STATES OF CYG X-1 AND RELATED SOURCES
Demosthenes Kazanas Jul. 1986 15 p Submitted for publication
(NASA-TM-89265; NAS 1.15:89265) Avail: NTIS
HC A02/MF A01 CSCL 03B

A model for active galactic nuclei (AGN), employing quasi-spherical accretion onto a black hole, when scaled down to solar mass objects, provides a straightforward account of the bimodal spectral behavior of Cyg X-1 and the other galactic black hole candidates. It is argued that the change in the spectrum is due to the drastic increase of the source compactness (L/R) with the accretion rate m and the subsequent conversion of most of the energy released by accretion into e(+)e(-) pairs. It is also argued that similar changes may be observed in active galactic nuclei. Author

HC A05/MF A01 CSCL 03B

The physics of the continuum spectrum of active galactic nuclei (AGNs) was examined using a large data set and rigorous statistical methods. A data base was constructed for 469 objects which include radio selected quasars, optically selected quasars, X-ray selected AGNs, BL Lac objects, and optically unidentified compact radio sources. Each object has measurements of its radio, optical, X-ray core continuum luminosity, though many of them are upper limits. Since many radio sources have extended components, the core component were carefully selected out from the total radio luminosity. With survival analysis statistical methods, which can treat upper limits correctly, these data can yield better statistical results than those previously obtained. A variety of statistical tests are performed, such as the comparison of the luminosity functions in different subsamples, and linear regressions of luminosities in different bands. Interpretation of the results leads to the following tentative conclusions: the main emission mechanism of optically selected quasars and X-ray selected AGNs is thermal, while that of BL Lac objects is synchrotron; radio selected quasars may have two different emission mechanisms in the X-ray band; BL Lac objects appear to be special cases of the radio selected quasars; some compact radio sources show the possibility of synchrotron self-Compton (SSC) in the optical band; and the spectral index between the optical and the X-ray bands depends on the optical luminosity. CLASSIFICATION OF N-TYPE CARBON STARS M.S. Thesis
William V. Bollwerk Jun. 1986 75 p
(AD-A171399) Avail: NTIS HC A04/MF A01 CSCL 03/2

Carbon stars are in an advanced state of evolution and are of interest for understanding the rapid evolutionary processes during late stages of stellar evolution. They are cool ($T<4000K$) stars with an atmospheric carbon to oxygen ratio (C/O) greater than one. Most other classes of stars exhibit atmospheric $C/O < 1$. Low resolution spectrophotometry has been used to examine the relationship between spectral class and effective temperatures in a sample of eleven cool carbon stars. Using effective temperatures from lunar occultation observations of Tsuji and Ridgeway et al, CN and C2 features have been examined for their utility as classification criteria. It is found that C2 strength is not a reliable temperature classification parameter, while CN should be useful. Comparison of the carbon star classification systems of Keenan and Morgan and that of Richer with recent derived temperatures and the results of this study indicates that the Richer classification system more accurately reflects the temperatures of cool carbon stars. CANONICAL QUANTIZATION OF GRAVITY

T. Christodoulakis and J. Zanelli Jul. 1985 15 p Prepared in cooperation with Chile Univ., Santiago

(DE86-702615; IC-85/102) Avail: NTIS (US Sales Only) HC A02/MF A01

We present a scheme for carrying out in part the program of quantization of gravity in canonical form. The idea is to exploit the covariance of any Lagrangian theory under changes in the generalized coordinates, to select a particular ordering for the operator constraints of quantum gravity. A modified form of the canonical commutation relations (CRSs) is used which maintains full covariance under diffeomorphisms in three-space. The resulting commutator algebra of these operators is found to close, as required by consistency. Some remarks are made about the possible renormalizability and unitarity of the resulting theory, as well as the possible vanishing of the renormalized cosmological constant. DOE

PLANE-PARALLEL AND BOW SHOCK MODELS OF HERBIG-HARO OBJECTS Ph.D. Thesis

Alejandro Christian Raga 1985 154 p

Avail: Univ. Microfilms Order No. DA8613204

It is now generally accepted that the emission line spectrum of Herbig-Haro objects is formed in the recombination region behind a shock wave. Plane-parallel shock wave models have been quite successful at reproducing many of the observed characteristics of these spectra, but in order to be able to predict line profiles and the spatial distribution of the emission, at least two-dimensional models are needed. In this thesis, a model for a bow shock formed around a bullet (which moves supersonically with respect to the surrounding medium) is developed, and is then used to predict position-velocity diagrams (i.e., long-slit spectra) and two-dimensional intensity contour maps for several emission lines. The thesis is divided into two parts: (1) A calculation of stationary, plane parallel shock wave models, in which a full treatment of the pre-shock region is included. The emission line spectra of both the pre- and the post-shock regions are predicted. (2) The development of a bow shock model (for a gas with an important radiative energy loss), from which the spatially resolved line spectrum is predicted. A qualitative comparison of the predictions from the bow shock models with recent observations of Herbig-Haro objects HH 1 and HH 32 shows that, at least for these two objects, a good agreement between the observations and the theory of a radiating bow shock is obtained. This seems to indicate that the emission line spectra of these two Herbig-Haro objects are formed in the recombination region behind a bow shock. Dissert. Abstr.

THE UPPER ATMOSPHERE OF VENUS: A TENTATIVE EXPLANATION OF ITS ROTATION

C. Boyer Sep. 1986 13 p Transl. into ENGLISH from L'Astronomie (France), v. 100, Feb. 1986 p 77-83 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(Contract NASw-4005)

(NASA-TM-88505; NAS 1.15:88505) Avail: NTIS HC A02/MF A01 CSCL 03B

The upper atmosphere of Venus seems to revolve every 4 days, while the planet rotates in 243 days. Mariner 10 UV data on the changing positions of dark spots in the upper Venusian clouds have supported estimations of speeds ranging from 120-240 m/s. High rates of acceleration and deceleration occur on the night side, the former between -110 to -90 deg and the latter continuing to -50 deg. Arch and Y formations have been seen repeatedly between -110 to -70 deg. The highest are seen at about -90 deg and the lowest at about -30 deg. The temperature of the cloud layer at 60 km altitude is about 20 C, the pressure is nearly one earth atmosphere, and complex molecules, including O, C, H, N and S and combinations of these are present in abundance. SOLAR FLUX AND GEOMAGNETIC ACTIVITY PREDICTION

Roberto VieriradaFonsecaLopez, Helio Koiti Kuga, and Valdemir Carrara May 1986 6 p Presented at TELECON, Rio De Janeiro, Brazil, 10-13 Oct. 1985

(INPE-3884-PRE/934) Avail: NTIS HC A02/MF A01

The main concern is the establishment of prediction models for the solar activity which greatly influences the behavior of the upper atmosphere constituent elements. Such models are aimed at applications in orbit computations of close earth satellites (< 1000 km) which, within this altitude range, are affected by atmospheric drag. Author

REPETITION RATES OF FAST PULSES IN MM-WAVES/X-RAY SOLAR BURSTS
E. Correia and P. Kaufmann Aug. 1986 29 p Presented at the 2nd CESRA Workshop, Aubigny, France, Jun. 1986 Sponsored in part by FINEP
(INPE-3974-PRE/986) Avail: NTIS HC A03/MF A01

The solar burst of 21 May, 1984, 1326 UT, presented radio spectral emission with turnover frequency above 90 GHz, well correlated in time with hard X-ray emission. It consisted of seven major time structures (1-3 seconds in duration), and each structure consisted of various fast pulses (30-60 ms rise times). The spectral indices between 30-90 GHz, and the power-law indices at hard X-ray exhibited sudden changes for each major time structure. The subsecond pulses are nearly in phase at 30 and 90 GHz, but the relative amplitude of the pulses at 90 GHz (approx. = 50%) were considerably larger than at 30 GHz (less than 5%). It was found that the 90 GHz and the 100 keV X-rays fluxes are proportional to the repetition rates of the subsecond pulses, and that the hard X-rays power law indices harden for higher repetition rates.

MAX '91: AN ADVANCED PAYLOAD FOR THE EXPLORATION OF HIGH ENERGY PROCESSES ON THE ACTIVE SUN
Jun. 1986 62 p
(NASA-TM-89271; NAS 1.15:89271) Avail: NTIS HC A04/MF A01

The results of a NASA science working group established to study a follow-on to the Solar Maximum Mission are given. A complement of instruments is suggested, with the primary objective of studying the physics of energetic processes in cosmic plasmas by observing high-energy phenomena in solar flares. High-quality flare observations will be possible with these instruments during the next peak in solar activity expected to last from 1990 through at least 1995. The primary objective of MAX '91 is to study energetic processes in cosmic plasmas by observing high-energy phenomena in solar flares. These processes, which are of general astrophysical importance, include energy release, particle acceleration, and energy transport. Results from comprehensive observing programs conducted during the last solar cycle have demonstrated the great scientific potential of high-energy emissions for addressing these central physical processes. Consequently, a payload optimized for observations of high-energy solar flare phenomena is suggested for MAX '91. It consists of the following four specific instruments: (1) a Fourier-transform X-ray and gamma-ray imager covering the energy range from a few keV to 1 MeV with arcsecond spatial resolution; (2) a cooled germanium X-ray and gamma-ray spectrometer with keV spectral resolution covering the energy range from 10 keV to 50 MeV; (3) Bragg spectrometers with high spectral resolution at wavelengths between 1 and 9 angstrons; and (4) a soft X-ray, EUV, or UV imaging instrument with arcsecond spatial resolution.

MAGNETIC FIELD RE-ARRANGEMENT AFTER PROMINENCE ERUPTION
R. A. Kopp and G. Poletto 1986 6 p Presented at the NASA Workshop on Coronal and Prominence Plasmas, Berkeley Springs, W. Va., 8 Apr. 1986 Prepared in cooperation with Osservatorio Astrofisico di Arcetri, Florence (Italy).
(Contract W-7405-eng-36)
(DE86-012393; LA-UR-86-1906; CONF-8604219-1) Avail: NTIS HC A02/MF A01

It has long been known that magnetic reconnection plays a fundamental role in a variety of solar events. Although mainly invoked in flare problems, large-scale loops interconnecting active regions, evolving coronal hole boundaries, the solar magnetic cycle itself, provide different evidence of phenomena which involve magnetic reconnection. A further example might be given by the magnetic field rearrangement which occurs after the eruption of a prominence. Since most often a prominence reforms after its disappearance and may be observed at about the same position it occupied before erupting, the magnetic field has to undergo a temporary disruption to relax back, via reconnection, to a configuration similar to the previous one. The above sequence of events is best observable in the case of two-ribbon (2-R) flares but most probably is associated with all filament eruptions. Even if the explanation of the magnetic field rearrangement after 2-R flares in terms of reconnection is generally accepted, the lack of a three-dimensional model capable of describing the field reconfiguration, has prevented, up to now, a thorough analysis of its topology as traced by H£/x-ray loops. The purpose of the present work is to present a numerical technique which enables one to predict and visualize the reconnected configuration, at any time, and therefore allows one to make a significant comparison of observations and model predictions throughout the whole process. LARGE-SCALE ELECTRIC FIELDS RESULTING FROM MAGNETIC RECONNECTION IN THE CORONA
R. A. Kopp and G. Poletto 1986 6 p Presented at the NASA Workshop on Coronal and Prominence Plasmas, Berkeley Springs, W. Va., 8 Apr. 1986 Prepared in cooperation with Osservatorio Astrofisico di Arcetri
(Contract W-7405-eng-36)
(DE86-012391; LA-UR-86-1907; CONF-8604219-2) Avail: NTIS HC A02/MF A01

The method of Forbes and Priest (2-D model) is applied to the large two-ribbon flare of July 29, 1973, for which both detailed H£ observations and magnetic data are available. For this flare the ribbons were long, nearly straight, and parallel to each other, and the 2-D model for the coronal field geometry may be adequate. The temporal profile E(t) is calculated and indicates that reconnection sets in at the beginning of the decay phase. From this time the electric field grows rapidly to a maximum value of about 2 V/cm within just a few minutes. Thereafter it decreases monotonically with time.

EQUILIBRIUM CONFIGURATION OF CORONAL LOOPS
V. Krishan Aug. 1985 10 p
(DE86-702711; IC-85/96) Avail: NTIS (US Sales Only) HC A02/MF A01

The steady-state pressure structure of a solar coronal loop is describable by a superposition of Chandrasekhar-Kendall functions. Each Chandrasekhar-Kendall function represents a force-free state. We extend this work to study the dynamical evolution of the loop as it moves outwards in the external medium while constantly maintaining its minimal energy configuration. This enables one to calculate the rate of energy dissipation as the loop moves outwards remaining in the minimal energy state under the invariance of the magnetic helicity and the magnetic fluxes. It is found that the nonaxisymmetric state becomes more favorable when the external pressure falls below a critical value. DOE

MODEL STUDIES OF SOLAR SPECTRAL IRRADIANCE AT THE BOTTOM AND TOP OF A CLOUDY ATMOSPHERE Ph.D. Thesis
Mark Vaughan Paris 1985 146 p
Avail: Univ. Microfilms Order No. DA8604013

The development and testing of a spectral model for transmission of solar radiation through a cloudy atmosphere are described. Clear-sky effects include absorption by ozone, water vapor, the uniformly-mixed gases and aerosols; and scattering by air molecules (Rayleigh scattering) and aerosols. These optical effects are treated with a Beer's Law relationship using extinction coefficients for each of 145 spectral intervals from 0.29 to 3.0 microns. Cloud optical effects are treated with the delta-Eddington approximation. The model calculates spectral irradiances at the surface and the top of the atmosphere. The model is tested against 221 hours of broad-band and spectral (greater than 630 nm) irradiances measured at the Georgia Tech Solar Energy Meteorological Research and Training Site. Upward irradiances at the top of the atmosphere are converted into directional radiances through empirical bidirectional reflectance factors and the resulting radiances are compared against radiances for 168 hours measured by satellite at the same time and at the same hours measured by satellite at the same time and at the same location. The model reproduces measured surface irradiances with a root-mean-square error of 11.7% of the model mean. The directional reflectances have an rms error of 16.4% of the model mean; when nine outlying points are removed from the data, the remaining data have an rms error of 12.5% of the mean. Testing of the model indicates that it has sufficient accuracy for such purposes as calibration of satellite sensors in the visible spectrum. Dissert. Abstr.

THE CARBON TWELVE TO CARBON THIRTEEN ISOTOPE RATIO OF THE INTERSTELLAR MEDIUM IN THE NEIGHBORHOOD OF THE SUN Ph.D. Thesis
Isabel Hawkins 1986 293 p
Avail: Univ. Microfilms Order No. DA8614091

The C-12/C-13 ratio in the interstellar medium (ISM) was obtained from optical observations of interstellar CH+ toward five stars in the solar neighborhood. This isotope ratio is a probe of nucleosynthesis and imposes stringent constraints on galactic chemical evolutionary models. As a result of this work, we have found that the local interstellar medium C-12/C-13 abundance ratios toward four different lines of sight are uniform within 14%. We thus provide concrete evidence in favor of the existence of a homogeneous ISM in a small scale. The similarity among the C-12/C-13 ratios determined in four interstellar clouds possessing different physical conditions, precludes the possibility that fractionation or selective photodissociation of CH+ are taking place in these regions. We can then safety state that the (12)CH+/(13) CH+ isotope ratios we have observed are representative of the C-12/C-13 ratios in the gas. We have thus calculated a weighted mean ratio of 43 +/- 4 from the measured values toward our program stars. From our observations we have been able to assess the amount of processing of material by nucleosynthesis in stars that has occurred since the formation of the Sun. Since our derived ISM ratios are a factor of two smaller than the value of 89 in the solar system, we concluded that the ISM has evolved chemically since the formation of the Sun, in accordance with the predictions put forth by the majority of the galactic chemical evolutionary models. Dissert. Abstr.

RAPID FLUCTUATIONS IN SOLAR FLARES
P. A. Sturrock Apr. 1986 31 p
(Contracts N00014-85-K-0111; NGL-05-020-272)
(NASA-CR-179894; NAS 1.26:179894; AD-A169586; AD-E500769; CSSA-ASTRO-86-29) Avail: NTIS HC A03/MF A01 CSCL 03/2

Study of rapid fluctuations in the emission of radiation from solar flares provides a promising approach for probing the magnetoplasma structure and plasma processes that are responsible for a flare. It is proposed that elementary flare bursts in X ray and microwave emission may be attributed to fine structure of the coronal magnetic field, related to the aggregation of photospheric magnetic field into magnetic knots. Fluctuations that occur on a sub-second time scale may be due to magnetic islands that develop in current sheets during magnetic reconnection. The impulsive phase may sometimes--or possibly always--represent the superposition of a large number of the elementary energy release processes responsible for elementary flare bursts. If so, one faces the challenge of trying to explain the properties of the impulsive phase in terms of the properties of the elementary processes. For instance, if the impulsive phase produces a power law energy distribution of energetic particles, this may be due to scaling laws governing the elementary processes rather than to power-law accelerations in each elementary event. THE ULTRAHEAVY COSMIC RAYS: PROPAGATION AND SELECTIVE ACCELERATION
Steven H. Margolis and J. Bernard Blake (Aerospace Corp., El Segundo, Calif.) *In* Aerospace Corp. Contributions to the 18th International Cosmic Ray Conference 10 Mar. 1986 p 1-4 Previously announced in IAA as A85-23003 (For primary document see N87-13389 04-93)
Avail: NTIS HC A02/MF A01

Results of calculations of ultraheavy cosmic ray propagation are examined in the light of recent observations and theoretical advances with the objective of distinguishing the effects of propagation from nucleosynthesis and preferential acceleration. The results presented here have been calculated by the method described in Margolis (1983), with elements from iron (Z = 26) to uranium (Z = 92) combined in a single calculation. The source abundances of Anders and Ebihara (1982) have been used as a reference composition. It is shown, in particular, that the relative abundances of Sr and Ba are substantially increased by using the modified ionization potential dependence (MIPD) compared with solar abundance and the first ionization potential dependence (FIPD) models. In contrast, Pb shows similar enhancements in both FIPD and MIPD models. IAA

THE SECONDARY PRODUCTION OF GAMMA RAYS IN THE JOVIAN MAGNETOSPHERE
J. Bernard Blake and Steven H. Margolis (Washington Univ., St. Louis, Mo.) *In its* Contributions to the 18th International Cosmic Ray Conference 10 Mar. 1986 p 5-8 Previously announced as A85-22972 (For primary document see N87-13389 04-93)
Avail: NTIS HC A02/MF A01

Photons in the MeV and above energy range resulting from interactions of energetic protons and electrons in the Jovian magnetosphere with the Jovian satellite Amalthea are studied. The photon flux as a function of Jovian radii is found to be 0.2/sq R(J) per sq cm/sec, a relatively low value. If the magnetospheric configuration at Jupiter is similar to that of the Earth, a nearly radiation-free region may exist below the trapped particles, but sufficiently high for an observing satellite to orbit with a reasonable drag lifetime. Avail: NTIS HC A02/MF A01

Some implications are considered of the possibility that the collapse of the solar nebula was induced by the supernova of an extremely massive star or, at least, such a star was in the vicinity of the protosolar nebula prior to its collapse to form the solar system. A very large star in the vicinity of the protosolar nebula can contribute to the protosolar nebula in several ways which differ from a smaller (but still large) star: (1) the high mass-loss rate of a very large star implies the dispersion into the nearby interstellar medium of many solar masses of freshly synthesized material (a substantial dilution can occur before its contribution is masked); (2) a significant amount of Al-26 is synthesized and dispersed well before the subsequent supernova; (3) energy is available in the stellar wind for accelerating cosmic rays in sufficient quantities to heavily irradiate nearby material; (4) the absence of freshly synthesized Pu-244 (no resetting of the plutonium clock) can be understood in a natural way; and (5) a significant amount of Pd-107 can be dispersed into the interstellar medium during a WC stage. NEUTRON AND ANTINEUTRON PRODUCTION IN ACCRETION ONTO COMPACT OBJECTS
Charles D. Dermer and Reuven Ramaty Jul. 1986 16 p Submitted for publication
(NASA-TM-89264; NAS 1.15:89264) Avail: NTIS HC A02/MF A01 CSCL 03B

Nuclear reactions in the hot accretion plasma surrounding a collapsed star are a source of neutrons, primarily through spallation and pion-producing reactions, and antineutrons, principally through the reaction p+p yields p+p+n+anti-n. We calculate spectra of neutrons and antineutrons produced by a variety of nonthermal energetic particle distributions in which the target particles are either at rest or in motion. If only neutral particles are free to escape the interaction site, a component of the proton and antiproton fluxes in the cosmic radiation results from the neutrons and antineutrons which leave the accretion plasma and subsequently decay in the interstellar medium. This additional antiproton component could account for the enhanced flux of antiprotons in the cosmic radiation, compared to values expected from the standard leaky-box model of cosmic-ray propagation and confinement. Moreover, the low-energy antiproton flux measured by Buffington et al. (1981) could result from target-particle motion in the accretion plasma. This model for the origin of antiprotons predicts a narrow 2.223 MeV line which could be observable. Author

X-RAY EMISSION FROM SUPERNOVA REMNANTS Ph.D. Thesis
Andrew James SackvilleHamilton 1984 327 p
Avail: Univ. Microfilms Order No. DA8517472

This thesis deals with the x-ray spectra of supernova remnants (SNRs), and in particular the x-ray spectra of the two young Type 1 SNRs SN1006 and Tycho. Firstly an extensive grid of nonequilibrium model spectra of SNRs in the adiabatic blast stage of evolution is computed, and numerous diagnostics of the state and composition of the blast wave plasma are plotted over parameter space. It is demonstrated that the spectrum of an adiabatic blast wave is a good approximation to several other model SNR structures in which emission is dominated by gas undergoing quasi steady state ionization near a shock front. None of these structures appears able to account for the observed spectra of SN1006 or Tycho. A new similarity solution for the early time evolution of uniform ejecta moving into an external medium is presented. It is argued that the x-ray spectra of SN1006 and Tycho are consistent with emission mainly from a reverse shock into 1.4 M(solar) of initially uniform density SN ejecta consisting of pure heavy elements, moving into a uniform medium. Satisfactory fits to the observed spectra are obtained with a two layer structure of ejecta, an outer layer of unprocessed material, and an inner layer of mixed processed heavy elements. The structure of ejecta inferred is similar for both SN1006 and Tycho, the marked difference between the two spectra being attributed largely to the lower density of the ambient medium around SN1006. The results are consistent with the theory of Type 1 SNe as exploded white dwarfs, and resolve the apparent problems of too little iron, and too much total mass, deduced by other authors from earlier analyses of the x-ray emission of SN1006 and Tycho. Dissert. Abstr.

OBSERVATIONS ON THE STANFORD 4800 KG GRAVITY WAVE DETECTOR WITH A COSMIC RAY MONITOR Ph.D. Thesis
Bruce Evan Moskowitz 1986 120 p
Avail: Univ. Microfilms Order No. DA8612771

The group at Stanford University has constructed a 4800 kg cryogenic detector which is the most sensitive detector for gravitational radiation successfully operated to date. In this dissertation data are presented from the 1985 run of 36.8 days aggregate collection time. Over the full bandwidth of approximately 13 Hz, the optimum detector noise temperature was found to be 8 mK when the system was operated at 4.3 K. An actual filter was implemented over a 5 Hz bandwidth which yielded the filtered noise temperature of 15 mK. Filtering over the entire bandwidth and operation of a dilution refrigerator at 1 K should lower the noise temperature to below 3 mK. The rate of events whose signal temperature exceeded 0.6 K was found to be higher than that for a similar run in 1981, partly due to greater general activity in the laboratory. A preliminary coincidence experiment was conducted between the Stanford detector and a room temperature detector in Guangzhou, China. In a total of 9.38 days of simultaneous data collection the number of coincidences observed was entirely consistent with random statistics. In the second half of this dissertation, the effect of cosmic rays on a gravity wave bar detector is considered. A one-dimensional thermoacoustic model is used to predict the size of the signal. Measurable effects are restricted to rarer events which may easily be vetoed as gravity wave candidates. Dissert. Abstr.

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7053).

On the two states of CYG X-1 and related sources
[NASA-TM-89265] N87-13367
ACID RAIN
Remote sensing to detect ecological impacts associated with acid deposition
[DE86-011649] N87-12992
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220357] N87-13014
ACOUSTIC FREQUENCIES
Knowledge-based pitch detection
[AD-A169069] N87-12730
ACOUSTIC MEASUREMENT
Supplementary calibration test of the tip-aerodynamics- and acoustics-test pressure transducers
[NASA-TM-88312] N87-12830
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
ACOUSTIC PROPAGATION
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Evaluating nonlinear effects in propagation of acoustic pulse in atmospheric surface layer in inversions N87-12951
ACOUSTIC PROPERTIES
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746
ACOUSTIC SCATTERING
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
ACOUSTIC VELOCITY
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169289] N87-12931
ACOUSTO-OPTICS
Optical processing
[AD-A169882] N87-13269
Acoustooptic spectrum analyzer using a planar Bragg-cell N87-13295
ACQUISITION
Language acquisition and machine learning
[AD-A169581] N87-13184
ACTUATORS
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169884] N87-12711
ADA (PROGRAMMING LANGUAGE)
Catalog of Resources for Education in Ada (Trade name) and Software Engineering (CREASE), version 4.0
[AD-A169892] N87-13186
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192
ADAPTIVE CONTROL
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905
Feedback system design with an uncertain plant
[NASA-CR-176687] N87-13243
ADAPTIVE FILTERS
Two-dimensional beamforming using a frequency domain complex Least Mean-Squares (LMS) adaptive filter
[AD-A171396] N87-12785
ADHESION
Zinc/air cell cathode
[AD-D012425] N87-12780
ADHESIVE BONDING
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
Adhesive repair patch
[AD-D012422] N87-12692
ADSORPTION
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169081] N87-12631
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169082] N87-12632
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169818] N87-12636
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329
Surface and adsorption-like states within the nearly free electron approximation
[DE86-702651] N87-13342
AEROACOUSTICS
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
AERODYNAMIC CHARACTERISTICS
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86786] N87-12558
AERODYNAMIC COEFFICIENTS
Supplementary calibration test of the tip-aerodynamics- and acoustics-test pressure transducers
[NASA-TM-88312] N87-12830
AERODYNAMIC CONFIGURATIONS
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
AERODYNAMIC DRAG
Propellar/body interaction for thrust and drag
[ESDU-86017] N87-12537
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543
AERODYNAMIC FORCES
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
AERODYNAMIC INTERFERENCE
An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow (axial force)
[BR-100271] N87-12540

SUBJECT

AERODYNAMIC LOADS
Introduction to aerodynamics derivitives, equations of motion and stability
[ESDU-86021] N87-12536
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
AERODYNAMIC STABILITY
Analysis of the nonlinear stability of circular Couette flow
[AD-A169951] N87-12611
AERODYNAMICS
Aeronautical Engineering: A continuing bibliography with indexes
[NASA-SP-7037(205)] N87-12532
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
AERONAUTICAL ENGINEERING
Aeronautical Engineering: A continuing bibliography with indexes
[NASA-SP-7037(205)] N87-12532
AEROSOLS
Measurement and calculation of the Stokes or Mueller matrix for the scattering of electromagnetic radiation from irregular particles
[AD-A171502] N87-12749
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
AEROSPACE ENGINEERING
The portfolio model of technological development in the aircraft industry
[AD-A170832] N87-12534
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715
AEROSPACE ENVIRONMENTS
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310
AEROSPACE INDUSTRY
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12872
AEROSPACE MEDICINE
Aerospace Medicine and Biology: A continuing bibliography with indexes
[NASA-SP-7011(290)] N87-13125
AEROSPACE SYSTEMS
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169185] N87-13350
AIR CONDITIONING EQUIPMENT
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
AIR COOLING
Self-locking outer air seal with full backside cooling
[AD-D012406] N87-12880
AIR DUCTS
Sliding duct seal
[AD-D012369] N87-12875
AIR FLOW
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
Meteorological summary of WATOX (western Atlantic Ocean experiment) 1985 research intensive, February-April
[PB86-226792] N87-13114
AIR LOCKS
Self-locking outer air seal with full backside cooling
[AD-D012406] N87-12880
AIR QUALITY
Southern California Air Quality Study (SCAQS) suggested program plan
[PB86-223427] N87-13013
AIR SEA ICE INTERACTIONS
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
AIR TRAFFIC CONTROL
Aircraft accident report: Bar Harbor Airlines Flight 1808, Beech BE-99, N300WP, Auburn-Lewiston Municipal Airport, Auburn, Maine, August 25, 1985
[PB86-910408] N87-12550
AIRBORNE EQUIPMENT
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86585] N87-12828
Radiometric calibration of the airborne imaging spectrometer N87-12969
Comparison of various techniques for calibration of AIS data N87-12970
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features N87-12972
Destriping AIS data using Fourier filtering techniques N87-12974
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS) N87-12978
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979
Use of digital Munsell color space to assist interretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12981
Analysis of AIS data of the Bonanza Creek Experimental Forest, Alaska N87-12982
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12983
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
Trace element-induced stress in freshwater wetland vegetation: Preliminary results N87-12985
Patterns of vegetation in the Owens Valley, California N87-12986
AIS spectra of desert shrub canopies N87-12987
Instrumentation research and support services
[AD-A169278] N87-13029
Airborne atmospheric electricity experiments N87-13063
Mobile intercept of storms N87-13064
Airborne Doppler measurements of the central California extended sea breeze N87-13066
AIRBORNE/SPACEBORNE COMPUTERS
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident/incident summary reports: Erie, Pennsylvania, October 14, 1984; Albuquerque, New Mexico, February 11, 1985
[PB86-910407] N87-12549
Aircraft accident report: Bar Harbor Airlines Flight 1808, Beech BE-99, N300WP, Auburn-Lewiston Municipal Airport, Auburn, Maine, August 25, 1985
[PB86-910408] N87-12550
AIRCRAFT ACCIDENTS
Crew communication as a factor in aviation accidents
[NASA-TM-88254] N87-13141
AIRCRAFT CARRIERS
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
AIRCRAFT COMMUNICATION
Crew communication as a factor in aviation accidents
[NASA-TM-88254] N87-13141
AIRCRAFT CONFIGURATIONS
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
AIRCRAFT CONTROL
Determination of the load and stress of a cockpit crew during aircraft piloting using task networks and the simulation language SAINT N87-13150
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/216] N87-13151
AIRCRAFT ENGINES
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915
AIRCRAFT EQUIPMENT
A heater made from graphite composite material for potential deicing application
[NASA-TM-88868] N87-12559
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169884] N87-12711
Aircraft battery state of charge and charge control system
[AD-A169411] N87-12766
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
AIRCRAFT HYDRAULIC SYSTEMS
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169884] N87-12711
AIRCRAFT INDUSTRY
The portfolio model of technological development in the aircraft industry
[AD-A170832] N87-12534
AIRCRAFT LANDING
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12868
AIRCRAFT MAINTENANCE
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
AIRCRAFT NOISE
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252
AIRCRAFT PERFORMANCE
Simplified forms of performance equations. Addendum A: Effect on aeroplane level speed of small changes in thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-12556
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
AIRCRAFT SAFETY
Crew factors in flight operations. Part 3: The operational significance of exposure to short-haul air transport operations
[NASA-TM-88322] N87-13122
AIRCRAFT STABILITY
Introduction to aerodynamics derivitives, equations of motion and stability
[ESDU-86021] N87-12536
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
AIRCRAFT STRUCTURES
Carbon fibers
[AD-A171370] N87-12622
AIRCRAFT TIRES
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12868
AIRFOILS
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
AIRFRAMES
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
AIRGLOW
Measurement of atmospheric emission spectra at high altitudes
[AD-A170143] N87-13035
Atmospheric illumination and shadows, revision 1
[DE86-010971] N87-13039
AIRPORTS
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
AIRSHIPS
Possible military applications of stratospheric airship discussed N87-12716
AIRSPEED
Simplified forms of performance equations. Addendum A: Effect on aeroplane level speed of small changes in thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-12556

ALASKA
Analysis of AIS data of the Bonanza Creek Experimental Forest, Alaska N87-12982
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106
ALBEDO
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038
ALERTNESS
Sleepability and wakeability following sleep deprivation
[AD-A169578] N87-13130
ALGEBRA
Canonical quantization of gravity
[DE86-702615] N87-13372
ALGORITHMS
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
Advanced guidance algorithms for homing missiles with bearing-only measurements
[AD-A170833] N87-12583
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169818] N87-12636
Carrier-sense stack algorithms for multiple access communication channels
[AD-A169774] N87-12738
Multi-element adaptive antenna array
[AD-D012410] N87-12740
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
A VLSI-based high-performance raster image system
[AD-A169086] N87-12761
Compaction with automatic jog introduction
[AD-A169679] N87-12772
Two-dimensional beamforming using a frequency domain complex Least Mean-Squares (LMS) adaptive filter
[AD-A171396] N87-12785
Development of an inexpensive, high resolution positron multiwire proportional counter
[DE86-011576] N87-12841
Atmospheric illumination and shadows, revision 1
[DE86-010971] N87-13039
Airborne atmospheric electricity experiments N87-13063
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
A software implementation of an interactive graphics system for three dimensional modeling and layout
[AD-A169264] N87-13183
The continuous projective sumt method for convex programming — sequential unconstrained minimization techniques
[AD-A169847] N87-13185
SOR (Successive Over-Relaxation) MGR (multigrid algorithm)(nu) experiments on the crystal multicomputer
[AD-A169929] N87-13187
An implicit enumeration procedure for the general linear complementarity problem
[AD-A170397] N87-13189
Matrix factorization on a hypercube multiprocessor
[DE86-011775] N87-13193
HOMPACK: A suite of codes for globally convergent homotopy algorithms
[DE86-011644] N87-13196
A generalized projection method for the solution of algebraic linear systems
[INPE-3874-PRE/930] N87-13205
Performance analysis of some numerical algorithms in the resolution of ODEs artificial satellite problems
[INPE-3996-PRE/995] N87-13206
Algorithm for positive definite least square estimation of parameters
[DE86-012159] N87-13225
Maintaining LU factors of a general sparse matrix
[AD-A169255] N87-13248
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
ALKALI HALIDES
Search for far infrared radiation from optically and acoustically pumped defect modes
[AD-A169159] N87-13319
ALKYL COMPOUNDS
Vapour pressures and critical points of liquids. Part 3A: C6 to C10 alkylbenzenes
[ESDU-86012-PT-3A] N87-12625
ALKYNES
Vapour pressures and critical points of liquids. Part 2C: Alkadienes and alkynes
[ESDU-86001-PT-2C] N87-12624
ALLOYS
Characterization of the atomic emission in Inconel 718 alloy metal vapor arcs
[DE86-012178] N87-12672
Metals and Ceramics Division Materials Sciences Program
[DE86-013512] N87-12699
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
ALTITUDE SIMULATION
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
ALUMINUM
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12658
Heat measurements in inertia welding of aluminum to steel
[DE86-012463] N87-12665
Factors influencing elastic stresses in double cantilever beam specimens
[NASA-TM-89033] N87-12922
ALUMINUM ALLOYS
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169830] N87-12620
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
A fundamental study of P/M processed elevated temperature aluminum alloys
[AD-A170697] N87-12657
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-008494] N87-12662
Atomic resolution study of precipitates in an Al-Ge alloy
[DE86-011308] N87-12670
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Cleaning of aluminum alloy 5083
[DE86-012573] N87-12675
Gas tungsten arc welding of aluminum alloys 6XXX. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012548] N87-12893
Gas tungsten arc welding of aluminum alloys 3004, 5052 and 5x54 to 6xxx. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012561] N87-12897
ALUMINUM OXIDES
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12688
ALUMINUM SILICATES
Low temperature formation of mullite
[AD-D012404] N87-12687
AMAZON REGION (SOUTH AMERICA)
Energy receipt partitioning over the Amazon forest
[INPE-3960-PRE/990] N87-12962
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/985] N87-12964
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon forest
[INPE-3949-PRE/970] N87-13008
AMINES
Methods for the synthases of mono-, di-, tri- and tetranitro derivatives of dipropylamine
[WSRL-0436-TR] N87-12702
AMMONIUM COMPOUNDS
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12961
AMMONIUM PERCHLORATES
Shifts in shuttle SRM performance because of ammonium perchlorate crystal shape on missions 51-I/J and 61-A/B
[NASA-TM-86561] N87-12607
AMMUNITION
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12564
AMORPHOUS MATERIALS
Status and future of government-supported amorphous silicon research in the US
[DE86-010702] N87-12997
AMPLIFIERS
Unique mechanization to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
AMPLITUDE MODULATION
Fiber optic device for temperature remote sensing N87-13280
AMPLITUDES
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
ANALYSIS (MATHEMATICS)
The application of boundary-element techniques for some soil-structure interaction problems
[AD-A169999] N87-12709
ANGLE OF ATTACK
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89050] N87-12538
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252
ANGULAR MOMENTUM
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
ANISOTROPIC SHELLS
Dynamic analysis of anisotropic conical shells
[EPM/RT-86-36] N87-12916
ANISOTROPY
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331
ANNEALING
Recrystallization behavior of ion beam modified Alpha-Al sub 2 O sub 3
[DE86-009353] N87-13335
ANNIHILATION REACTIONS
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394
ANNUAL VARIATIONS
US Navy climatic study of the Caribbean Sea and Gulf of Mexico. Volume 2: East Caribbean Sea
[AD-A171467] N87-13112
The Gulf Stream dynamics experiment. Inverted echo sounder data report for the June 1984 to May 1985 deployment period
[AD-A170758] N87-13121
ANNULAR FLOW
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
ANODES
Advanced electric propulsion MPD (magnetoplasmadynamic)
[AD-A169792] N87-12610
ANOMALIES
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
Low Q spin-up from rest
[AD-A169106] N87-12913
Summary of 1986 Atlantic tropical cyclone activity and verification of author's seasonal forecast N87-13097
ANTARCTIC REGIONS
Stratospheric balloon experiments
[INPE-3995-RPE/519] N87-13020
ANTENNA ARRAYS
Phased arrays 1985 symposium: Proceedings
[AD-A169316] N87-12732
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
Multi-element adaptive antenna array
[AD-D012410] N87-12740
Twin aperture phased array lens antenna
[AD-D012415] N87-12745
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784
ANTENNA DESIGN
Dielectric antennas for millimeter-wave applications
[AD-A169885] N87-12739

Development of a numerical procedure to treat wires attached to arbitrarily shaped conducting bodies
[AD-A169364] N87-12764

ANTENNA RADIATION PATTERNS
Vector analysis and satellite footprints
[AD-A169832] N87-12576

ANTENNAS
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-12602
Foraground effects on troposcatter digital communication systems
[AD-A169360] N87-12734

ANTHROPOMETRY
Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems
[DGLR-85-04] N87-13146
Anthropometric handicaps in the construction of a helicopter cockpit — seats N87-13148

ANTINUCLEONS
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395

ANTIREFLECTION COATINGS
Solid-state electrochromic switchable window glazings
[DE86-004455] N87-12700

APERTURES
New electromagnetic effects associated with cavity-backed apertures
[DE86-006766] N87-12750
Development of a large-aperture PLZT shutter with enhanced operational/environmental capabilities
[DE86-011643] N87-12838

APPLICATIONS PROGRAMS (COMPUTERS)
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933
Conversion of the NOLAPS (Navy Operational Local Atmospheric Prediction System) model to the HP9845
[AD-A169638] N87-13106

APPROACH
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573

APPROPRIATIONS
Department of Housing and Urban Development-independent agencies appropriations for 1987, part 7
[GPO-81-970] N87-13357

APPROXIMATION
An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow (axial force)
[BR-100271] N87-12540
Semigroups and Poisson-approximation
[AD-A170944] N87-13224
Extremal processes, record times and strong approximation
[AD-A169972] N87-13237
Surface and adsorption-like states within the nearly free electron approximation
[DE86-702651] N87-13342

ARC LAMPS
Very high efficacy electrodeless high intensity discharge lamps
[DE86-013760] N87-12803

ARC WELDING
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12850
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12886
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12887
Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12888
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12890
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12891
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012536] N87-12892

ARCHITECTURE (COMPUTERS)
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3956-PRE/876] N87-12720
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
ERS-1 SAR data processing
[NASA-CR-179913] N87-12965
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
High performance parallel computing
[AD-A169981] N87-13188
Interpretive model for a concurrency method
[DE86-012743] N87-13197
Solving scientific problems on hypercube parallel computers
[DE86-012622] N87-13199
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200
SOAR user's manual
[AD-A169005] N87-13204

ARCTIC REGIONS
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119

ARMATURES
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258

ARMED FORCES (UNITED STATES)
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1986
[AD-A169473] N87-13346

ARRAYS
Development of low-temperature transistor modules to improve the MSFC mid-infrared array
[NASA-TM-86566] N87-12756
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12757

ARTIFICIAL INTELLIGENCE
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567
A prototype maintenance expert system for the CH-47 flight control hydraulic system
[AD-A169019] N87-12568
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
Language acquisition and machine learning
[AD-A169581] N87-13184
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198
SOAR user's manual
[AD-A169005] N87-13204
Application of a network associative scene analysis model
[INPE-3945-PRE/967] N87-13244

ARTIFICIAL SATELLITES
Vector analysis and satellite footprints
[AD-A169832] N87-12576
Attitude control of an artificial satellite by extending the linear quadratic regulator theory
[INPE-3959-PRE/977] N87-12588
A procedure for attitude determination of artificial satellites utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3895-PRE/937] N87-12590
Performance analysis of some numerical algorithms in the resolution of ODEs artificial satellite problems
[INPE-3996-PRE/995] N87-13206

ASPECT RATIO
Comparison of Rayleigh-Taylor growth with 1.0 m and 0.25 m lasers
[DE86-012217] N87-12862

ASSEMBLIES
Super gripper variable vane arm
[AD-D012364] N87-12874

ASSEMBLY LANGUAGE
High performance parallel computing
[AD-A169981] N87-13188

ASSOCIATIVE PROCESSING (COMPUTERS)
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181

ASTROMETRY
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178

ASTRONAUT TRAINING
NOSL experiment support
[NASA-CR-178947] N87-13140

ASTRONOMICAL MODELS
On the two states of CYG X-1 and related sources
[NASA-TM-89265] N87-13367
X-ray emission from supernova remnants N87-13398

ASTRONOMICAL OBSERVATORIES
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396

ASTRONOMICAL SPECTROSCOPY
Investigations of long-period DQ Herculis star N87-13364

ASTRONOMICAL TELESCOPES
The space station millimeter facility
[AD-A169983] N87-12604

ASTROPHYSICS
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396

ASYMPTOTIC METHODS
The optimal linear combination of control variates in the presence of bias
[AD-A169111] N87-13210
Semigroups and Poisson-approximation
[AD-A170944] N87-13224
Extreme values of birth and death processes and queues
[AD-A169932] N87-13235
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236

ASYMPTOTIC SERIES
Validity of Edgeworth expansions of minimum contrast estimators for Gaussian ARMA processes
[AD-A169931] N87-13217
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230
A reversal argument for storage models defined on semi-Markov processes
[AD-A169262] N87-13232

ATLANTIC OCEAN
Summary of 1986 Atlantic tropical cyclone activity and verification of author's seasonal forecast N87-13097
Meteorological summary of WATOX (western Atlantic Ocean experiment) 1985 research intensive, February-April
[PB86-226792] N87-13114
A survey of hard-X-rays at balloon altitudes of the Earth's atmosphere
[INPE-3954-PRE/972] N87-13388

ATMOSPHERIC BOUNDARY LAYER
Studies of humid continental haze during SPACE N87-13066

ATMOSPHERIC CHEMISTRY
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024

ATMOSPHERIC CIRCULATION
Convective surface layers: Influence of the boundary layer depth N87-13041
Theoretical and experimental studies of baroclinic processes N87-13044
Theoretical and experimental design studies for the Atmospheric General Circulation Experiment N87-13046

Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
Variation objective analyses for cyclone studies N87-13050
Utilization of satellite cloud information to diagnose the energy state and transformations in extratropical cyclones N87-13051
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
Response of the mesoscale atmosphere to diabatic heating N87-13069
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071
Numerical simulation of convective response to mesoscale forcing N87-13081
Radiation flux tables for ICRCCM using the GLA GCM radiation codes
[NASA-TM-89270] N87-13098
On the Walker circulation of 1983-84
[INPE-3952-PRE/971] N87-13118
The upper atmosphere of Venus: A tentative explanation of its rotation
[NASA-TM-88505] N87-13375

ATMOSPHERIC COMPOSITION
Characterization of information requirements for studies of CO2 effects: Water resources, agriculture, fisheries, forests and human health
[DE86-012477] N87-13010
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011006] N87-13040

ATMOSPHERIC CORRECTION
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution remote sensing N87-12973
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979

ATMOSPHERIC EFFECTS
Comparison of various techniques for calibration of AIS data N87-12970
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971

ATMOSPHERIC ELECTRICITY
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Storm severity detection (RF) N87-13057
Airborne atmospheric electricity experiments N87-13063
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111

ATMOSPHERIC GENERAL CIRCULATION EXPERIMENT
Theoretical and experimental design studies for the Atmospheric General Circulation Experiment N87-13046

ATMOSPHERIC HEATING
Response of the mesoscale atmosphere to diabatic heating N87-13069

ATMOSPHERIC MODELS
Middle atmosphere modeling
[NASA-CR-179934] N87-13023
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
A semi-empirical low-latitude ionospheric model
[AD-A168699] N87-13025
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011006] N87-13040
Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
The use of satellite data in understanding and predicting convective and large-scale dynamical processes N87-13049
Variation objective analyses for cyclone studies N87-13050
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
Mesoscale research activities with the LAMPS model N87-13078
Cooperative VAS program with NASA Marshall Space Flight Center N87-13079
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090
Radiation flux tables for ICRCCM using the GLA GCM radiation codes
[NASA-TM-89270] N87-13098
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102
Conversion of the NOLAPS (Navy Operational Local Atmospheric Prediction System) model to the HP9845
[AD-A169538] N87-13106
A sensitivity study of a one-dimensional time-dependent warm cumulus cloud model
[AD-A170141] N87-13109
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13385

ATMOSPHERIC MOISTURE
Application of satellite data to tropic/subtropic moisture coupling N87-13053
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
Cooperative VAS program with NASA Marshall Space Flight Center N87-13079
Statistical analysis and use of VAS radiance data N87-13086
Improved satellite retrievals and mesoscale moisture variability N87-13087
Studies of humid continental haze during SPACE N87-13088

ATMOSPHERIC PHYSICS
Instrumentation research and support services
[AD-A169278] N87-13029
Measurement of atmospheric emission spectra at high altitudes
[AD-A170143] N87-13035
Airborne atmospheric electricity experiments N87-13063

ATMOSPHERIC PRESSURE
Meteorological effects of geotectonic phenomena hypothesized N87-12947
Station climatic summaries, Europe
[AD-A167888] N87-13100
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106

ATMOSPHERIC RADIATION
Regular noise background in VLF-radiation and world thunderstorm centers N87-12957
Stratospheric balloon experiments
[INPE-3995-RPE/519] N87-13020
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102

ATMOSPHERIC SCATTERING
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13385

ATMOSPHERIC SOUNDING
Spatial radio wave attenuation during vertical sounding of ionosphere N87-12958
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Mesoscale-cloud scale simulation of convective response N87-13077
Mesoscale research activities with the LAMPS model N87-13078
Cooperative VAS program with NASA Marshall Space Flight Center N87-13079
The assimilation of satellite soundings, winds and satellite products in a mesoscale analysis/forecast system N87-13080
Numerical simulation of convective response to mesoscale forcing N87-13081
Time composite sounding N87-13083
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13084
Statistical analysis and use of VAS radiance data N87-13086
Improved satellite retrievals and mesoscale moisture variability N87-13087
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
A sensitivity study of a one-dimensional time-dependent warm cumulus cloud model
[AD-A170141] N87-13109

ATMOSPHERIC TEMPERATURE
Station climatic summaries, Europe
[AD-A167888] N87-13100
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103

ATMOSPHERIC TIDES
Middle Atmosphere Program. Handbook for MAP, volume 21
[NASA-CR-179893] N87-13015
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-6, 1984 N87-13016
Proceedings of the Workshop on Atmospheric Tides, Prague, Czechoslovakia, August 14, 1985 N87-13017
Minutes of MAP/WINE experimenters meeting, Prague, Czechoslovakia, August 13, 1985 N87-13018

ATMOSPHERIC TURBULENCE
Evaluating nonlinear effects in propagation of acoustic pulse in atmospheric surface layer in inversions N87-12951
Experimental research on turbulence in upper-level tropospheric clouds N87-12952
Solar control of geophysical phenomena N87-12953
Characteristics of atmospheric turbulence near the ground. Part 3: Variations in space and time for strong winds (neutral atmosphere)
[ESDU-86010-PT-3] N87-13042
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110

ATOMIC BEAMS
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12663
Polarized H(-) source development at BNL
[DE86-012704] N87-13257

ATOMIC ENERGY LEVELS
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693

ATOMIC SPECTRA
Characterization of the atomic emission in Inconel 718 alloy metal vapor arcs
[DE86-012178] N87-12672

ATOMIC STRUCTURE
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652

ATOMS
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693

ATTENTION
Perceptual factors in workload: A neuromagnetic study
[AD-A169934] N87-13142

ATTITUDE (INCLINATION)
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86785] N87-12558

ATTITUDE CONTROL
Attitude control of an artificial satellite by extending the linear quadratic regulator theory
[INPE-3959-PRE/977] N87-12588
A procedure for attitude determination of artificial satellites utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3895-PRE/937] N87-12590
Brief analysis of normal attitude accuracies of satellites with wheels or gas jets
[INPE-3993-NTE/262] N87-12594

ATTITUDE STABILITY
Brief analysis of normal attitude accuracies of satellites with wheels or gas jets
[INPE-3993-NTE/262] N87-12594

AUDITORY PERCEPTION
Perceptual factors in workload: A neuromagnetic study
[AD-A169934] N87-13142

AUGER SPECTROSCOPY
Electron spectroscopy in fundamental catalytic studies
[DE86-006781] N87-12639

AURORAL ABSORPTION
Transverse resonances of Earth-ionosphere wave guide in auroral region N87-12956

AURORAL IRRADIATION
Effect of pulsating auroras on frequency-time characteristics of radio signals reflected from auroral ionosphere N87-12954

AURORAL ZONES
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
AURORAS
The current-voltage relationship in auroral current sheets
[AD-A169074] N87-13028
AUSTENITE
Design of strong, ductile, HSLA and dual phase steels
[DE86-011313] N87-12665
AUSTENITIC STAINLESS STEELS
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-006537] N87-12667
AUSTRALIA
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features
N87-12972
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979
AUTOMATIC CONTROL
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12834
Evaluation of the multifunction sensor acceleration sensitive terms MU sub A and MU sub B
[AD-A169811] N87-12835
The siting, installation and operational suitability of the Automated Weather Observing System (AWOS) at heliports
[DOT/FAA/PM-86/30] N87-13099
System-ergonomic workload analysis for highly automated process control tasks N87-13152
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203
Electronic forms. How close to value-added processing
[DE86-010484] N87-13354
AUTOMOBILES
The measurement of the psychological workload during task-related activities, including car driving, by competing time interval estimation N87-13153
AVAILABILITY
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
AVALANCHE DIODES
Millimeter-wave heterojunction two-terminal devices
[AD-A168985] N87-12760
AXIAL FLOW
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
AXIAL FLOW TURBINES
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560
AXISYMMETRIC FLOW
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87675] N87-12806
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
AZIMUTH
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
Two-dimensional beamforming using a frequency domain complex Least Mean-Squares (LMS) adaptive filter
[AD-A171396] N87-12785

B

BACKSCATTERING
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
Analysis of Doppler lidar data N87-13067
BACKWARD DIFFERENCING
Quantitative assessment of the effect of partial pivoting in sparse ordinary differential equation solvers
[DE86-012592] N87-13226
BAINITE
Bainite in chromium-molybdenum steels
[DE86-011781] N87-12666
BALLISTICS
Low Q spin-up from rest
[AD-A169106] N87-12813
BALLOON-BORNE INSTRUMENTS
Collection of ions in the stratosphere
[AD-A169905] N87-13032
Mobile intercept of storms N87-13064
Doppler wind profile experiment N87-13094
BAND STRUCTURE OF SOLIDS
Band description of materials with localizing orbitals
[DE86-010529] N87-13255
BANDPASS FILTERS
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
BANDWIDTH
Very low bandwidth, unattended imager for surveillance applications
[DE86-013570] N87-12799
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236
BAROCLINIC INSTABILITY
Theoretical and experimental studies of baroclinic processes N87-13044
Theoretical and experimental design studies for the Atmospheric General Circulation Experiment
N87-13046
BAROCLINIC WAVES
Theoretical and experimental studies of baroclinic processes N87-13044
Theoretical and experimental design studies for the Atmospheric General Circulation Experiment
N87-13046
The use of satellite data in understanding and predicting convective and large-scale dynamical processes
N87-13049
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
BAROTROPIC FLOW
The use of satellite data in understanding and predicting convective and large-scale dynamical processes
N87-13049
BATTERY CHARGERS
Aircraft battery state of charge and charge control system
[AD-A169411] N87-12766
BAYES THEOREM
A Bayesian approach to quantile and response probability estimation with applications in reliability
[AD-A170455] N87-13240
BEAM WAVEGUIDES
Transverse resonances of Earth-ionosphere wave guide in auroral region N87-12956
BEAMS (RADIATION)
Method and apparatus for rapid optical phasing
[AD-D012412] N87-13270
BEAMS (SUPPORTS)
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
BEND TESTS
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
BENDING
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918
BENZENE
Vapour pressures and critical points of liquids. Part 3A: C6 to C10 alkylbenzenes
[ESDU-86012-PT-3A] N87-12625
BERMUDA
Meteorological summary of WATOX (western Atlantic Ocean experiment) 1985 research intensive, February-April
[PB86-226792] N87-13114
BERNOULLI THEOREM
Semigroups and Poisson-approximation
[AD-A170944] N87-13224
BERYLLIUM
Fracture toughness of CIP-HIP beryllium at elevated temperatures
[AD-A169769] N87-12654
Calculated versus experimental charge density distribution of Be metal
[AD-A168924] N87-13254
BIAS
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
A procedure for automatic treatment of dynamic system istate observation bias errors
[INPE-3908-PRE/918] N87-1317
BIBLIOGRAPHIES
Aeronautical Engineering: A continuing bibliography wi indexes
[NASA-SP-7037(205)] N87-1253
Quality management: An annotated bibliography
[AD-A169816] N87-1291
Direct effects of atmospheric CO2 enrichment on plan and ecosystems: A bibliography with abstracts
[DE86-013525] N87-1301
Mesoscale ageostrophic circulations associated wi baroclinic jet streaks N87-1307
Aerospace Medicine and Biology: A continuin bibliography with indexes
[NASA-SP-7011(290)] N87-1312
Human performance aspects of small screen display A literature review revealing the lack of specific resear
[AD-A170860] N87-1317
Government libraries. A periodicals bibliograph together with list of bibliographies and indexes
[AD-A169422] N87-1339
BILLETS
Process for carbon-carbon composite fabrication
[AD-D012413] N87-1262
BINARY ALLOYS
Finite mean-free-paths and the electrical resistivity liquid simple metals and binary alloys
[DE86-702662] N87-1267
BINARY DATA
Method of fabricating high efficiency binary planar optic elements
[AD-D012374] N87-1326
BINARY STARS
Investigations of long-period DQ Herculis star
N87-1338
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-1337
BINARY SYSTEMS (MATERIALS)
Investigation of deviations from ideality in the two liqu phase region of systems of medium molecular weig hydrocarbon mixtures and water
[AD-A169752] N87-1263
A study of the mechanism of dynamic ductile fractu of two-phase materials
[AD-A168966] N87-1292
Possibility of using dc conductivity for investigating phas transition in amorphous semiconductors
[DE86-702646] N87-1334
BIOASTRONAUTICS
Aerospace Medicine and Biology: A continuin bibliography with indexes
[NASA-SP-7011(290)] N87-1312
BIOCHEMISTRY
Analysis of AIS data of the Bonanza Creek Experiment Forest, Alaska N87-1296
Trace element-induced stress in freshwater wetla vegetation: Preliminary results N87-1296
BIODYNAMICS
Radiographic determination of mass and inertial tens of anatomical segments
[AD-A169122] N87-1312
Fracture and viscoelastic characteristics of the huma cervical spine
[AD-A170002] N87-1313
Guidelines for safe human experimental exposure impact acceleration
[AD-A169347] N87-1316
BIOLOGICAL EFFECTS
Aerospace Medicine and Biology: A continuin bibliography with indexes
[NASA-SP-7011(290)] N87-1312
Physical interaction of 1-Hz to 100 kHz electric a magnetic fields with living organisms
[DE86-012323] N87-1313
BIOLOGY
Biological and clinical dosimetry, July 1, 1964 December 31, 1964
[DE86-006947] N87-1313
BIOPHYSICS
Mechanical transduction: Unification
[AD-A171191] N87-1312
Physical interaction of 1-Hz to 100 kHz electric a magnetic fields with living organisms
[DE86-012323] N87-1313
BIOTECHNOLOGY
Japan report: Science and Technology
[JPRS-JST-86-023] N87-1271
BIOTITE
Abundance and distribution of mineral componen associated with Moses Rock (kimberlite) diatreme
N87-1297
BIREFRINGENCE
Nonlinear ellipse rotation in a low-birefringence optic fiber N87-1326

BISTABLE CIRCUITS
Phase conjugate optics and picosecond optoelectronics
[AD-A169180] N87-13265
BIVARIATE ANALYSIS
Inequalities for probability contents of convex sets via geometric average
[AD-A169936] N87-13219
BL LACERTAE OBJECTS
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368
BLACK HOLES (ASTRONOMY)
On the two states of CYG X-1 and related sources
[NASA-TM-89265] N87-13367
BLADE SLAP NOISE
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
BLADE TIPS
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
The evaluation of a number of prototypes for the free-tip rotor constant-moment controller
[NASA-TM-86664] N87-12869
BLANKETS (FUSION REACTORS)
Compact reactor studies
[DE86-013247] N87-13263
BLAST LOADS
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570
BLUNT BODIES
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87675] N87-12806
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
BODIES OF REVOLUTION
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13264
BOILERS
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12886
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012536] N87-12892
BOLTS
Over-center toggle latch
[AD-D012393] N87-12878
BONDING
Phase equilibrium predictions for polar and hydrogen bonding mixtures
[DE86-011812] N87-12842
BONES
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
BORON CARBIDES
Raman spectroscopy of carboranes and polycarboranesiloxanes
[DE86-009030] N87-12894
BORON OXIDES
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013754] N87-12902
BOSONS
Supergravity
[DE86-701481] N87-13370
BOTANY
Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop
[NASA-CR-179924] N87-12968
BOUNDARY ELEMENT METHOD
The application of boundary-element techniques for some soil-structure interaction problems
[AD-A168999] N87-12709
BOUNDARY LAYER SEPARATION
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
BOUNDARY LAYERS
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
Convective surface layers: Influence of the boundary layer depth N87-13041
BOUNDARY VALUE PROBLEMS
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915
Regularity of the solution of elliptic problems with piecewise analytic data. Part 1: Boundary value problems for linear elliptic equation of second order
[AD-A169771] N87-13212
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314
Large-scale electric fields resulting from magnetic reconnection in the corona
[DE86-012391] N87-13383
BOW WAVES
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
BRAIN
X-ray fluorescence with synchrotron radiation
[DE86-010543] N87-13124
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144
BRAZIL
Geologic remote sensing at INPE: An overview
[INPE-3975-PRE/987] N87-12959
In retrospect: The impact of research production in the area of remote sensing
[INPE-3987-NTE/261] N87-12988
BREMSSTRAHLUNG
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368
BRIGHTNESS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
BRILLOUIN ZONES
Use of Wannier function in the calculations of band structure of covalent crystals
[DE86-702668] N87-13344
BRITTLENESS
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
BROADBAND
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A168971] N87-13026
BROADCASTING
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169786] N87-12554
BROMINATION
Effects of graphitization on the environmental stability of brominated pitch-based fibers
[NASA-TM-88899] N87-12679
BROMINE
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
BRONZES
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-13328
BUBBLES
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12623
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
BUDGETING
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
BUTT JOINTS
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914

C

CADMIUM SULFIDES
Stable, high-efficiency, CuInSe2-based polycrystalline thin-film tandem solar cells
[DE86-010705] N87-13003
CADMIUM TELLURIDES
Stable, high-efficiency, CuInSe2-based polycrystalline thin-film tandem solar cells
[DE86-010705] N87-13003
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337
CALCIUM OXIDES
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013754] N87-12902
CALCULUS
Superconformal tensor calculus and matter couplings in six dimensions
[DE86-702617] N87-13349
CALIBRATING
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86565] N87-12828
Supplementary calibration test of the tip-aerodynamics- and acoustics-test pressure transducers
[NASA-TM-88312] N87-12830
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831
Radiometric calibration of the airborne imaging spectrometer N87-12969
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975
Calibration and accuracy of the NOAA/ERL gust probe system and intercomparison with other systems
[PB86-221736] N87-13116
CALIFORNIA
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Use of digital Munsell color space to assist interpretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980
Trace element-induced stress in freshwater wetland vegetation: Preliminary results N87-12985
Patterns of vegetation in the Owens Valley, California N87-12986
Southern California Air Quality Study (SCAQS) suggested program plan
[PB86-223427] N87-13013
CAMERA SHUTTERS
Development of a large-aperture PLZT shutter with enhanced operational/environmental capabilities
[DE86-011643] N87-12838
CAMERAS
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396
CANCELLATION CIRCUITS
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
CANONICAL FORMS
Canonical quantization of gravity
[DE86-702615] N87-13372
CANOPIES (VEGETATION)
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/985] N87-12964
Destriping AIS data using Fourier filtering techniques N87-12974
Analysis of AIS data of the Bonanza Creek Experimental Forest, Alaska N87-12982
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12983
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
Patterns of vegetation in the Owens Valley, California N87-12986
AIS spectra of desert shrub canopies N87-12987
CANTILEVER BEAMS
Factors influencing elastic stresses in double cantilever beam specimens
[NASA-TM-89033] N87-12922
CAPILLARY TUBES
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12623

CARBON
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706
CARBON DIOXIDE CONCENTRATION
Characterization of information requirements for studies of CO2 effects: Water resources, agriculture, fisheries, forests and human health
[DE86-012477] N87-13010
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
Direct effects of atmospheric CO2 enrichment on plants and ecosystems: A bibliography with abstracts
[DE86-013525] N87-13012
CARBON DIOXIDE LASERS
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12863
CARBON FIBERS
Carbon fibers
[AD-A171370] N87-12622
Effects of graphitization on the environmental stability of brominated pitch-based fibers
[NASA-TM-88699] N87-12679
CARBON MONOXIDE
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169062] N87-12632
CARBON STARS
Classification of N-type carbon stars
[AD-A171399] N87-13369
CARBON STEELS
Design of strong, ductile, HSLA and dual phase steels
[DE86-011313] N87-12666
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12687
Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12688
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12689
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12690
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12691
Gas tungsten arc welding of carbon steel to nickel-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012549] N87-12694
CARBON 12
The carbon twelve to carbon thirteen isotope ratio of the interstellar medium in the neighborhood of the sun
N87-13386
CARBON 13
The carbon twelve to carbon thirteen isotope ratio of the interstellar medium in the neighborhood of the sun
N87-13386
CARBON-CARBON COMPOSITES
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
Process for carbon-carbon composite fabrication
[AD-D012413] N87-12621
CARBORANE
Raman spectroscopy of carboranes and polycarboranesiloxanes
[DE86-009030] N87-12694
CARDIOVASCULAR SYSTEM
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127
CARIBBEAN SEA
US Navy climatic study of the Caribbean Sea and Gulf of Mexico. Volume 2: East Caribbean Sea
[AD-A171487] N87-13112
CASCADE FLOW
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12595
CATACLYSMIC VARIABLES
Investigations of long-period DQ Herculis star
N87-13364
CATALYSIS
Electron spectroscopy in fundamental catalytic studies
[DE86-008781] N87-12639
Heterogeneous catalysis with lasers
[AD-A169601] N87-12651
CATALYSTS
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169818] N87-12636
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696
CATHODES
Efficient, monochromatic, high-power microwave generator
[DE86-012385] N87-12792
CATIONS
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
CAVITATION FLOW
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
CAVITIES
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
CAVITY RESONATORS
New electromagnetic effects associated with cavity-backed apertures
[DE86-008798] N87-12750
Stabilization of voltage-controlled oscillators through resonant cavities
[INPE-3941-RPE/512] N87-12757
Application of nonlinear optics to free electron laser systems
[AD-A169850] N87-12845
CELESTIAL REFERENCE SYSTEMS
Relative motion of the Sun on an artificial satellite
[INPE-3985-NTE/260] N87-12591
CELL CATHODES
Ni-Co alloy plaque for cathode of Ni-Cd battery
[AD-D012375] N87-12789
Zinc/air cell cathode
[AD-D012425] N87-12790
CEMENTS
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A169877] N87-12758
CENTRIFUGES
A variational principle for the plasma centrifuge
[INPE-3989-PRE/992] N87-12827
CERAMIC COATINGS
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
CERAMICS
Comparative thermal conductivity measurements at Sandia National Laboratories
[DE86-012926] N87-12647
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12686
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Metals and Ceramics Division Materials Sciences Program
[DE86-013512] N87-12699
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A169877] N87-12758
Preliminary material testing of ceramic and wood
[AD-A169557] N87-12771
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A169948] N87-12870
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910
A constitutive law for finite element contact problems with unclassical friction
[NASA-TM-88838] N87-12924
CH-47 HELICOPTER
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567
A prototype maintenance expert system for the CH-47 flight control hydraulic system
[AD-A169019] N87-12568
CHALCOGENIDES
Glass fibres for transmission in the 8-12 micrometers wavebend
N87-13297
CHALLENGER (ORBITER)
Investigation of the Challenger accident, volume 2
[GPO-64-548] N87-12586
CHANNEL NOISE
Multichannel phase noise measurement system
[AD-D012372] N87-13253
CHARGE DISTRIBUTION
Optical characteristics of lightning and thunderstorm currents N87-13061
CHARGED PARTICLES
Fragmentation dynamics of energetic materials
[AD-A169925] N87-12662
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/988] N87-12843
CHARTS
US Navy climatic study of the Caribbean Sea and Gulf of Mexico. Volume 2: East Caribbean Sea
[AD-A171487] N87-13112
CHEMICAL ANALYSIS
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12640
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13336
CHEMICAL BONDS
Investigation of the effects of short chain processing additives on polymers
[NASA-TM-89023] N87-12614
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169062] N87-12632
Rusty bolt intermodulation interference reducer
[AD-D012417] N87-12691
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169805] N87-13324
CHEMICAL COMPOSITION
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
Microchemical analysis of polycrystalline Ni3Al and other ordered alloys using the field-ion microscope atom probe
[DE86-013157] N87-12677
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
CHEMICAL ENGINEERING
Vapour pressures and critical points of liquids. Part 2C: Alkadienes and alkynes
[ESDU-86001-PT-2C] N87-12624
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715
CHEMICAL EQUILIBRIUM
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
CHEMICAL FUELS
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627
CHEMICAL LASERS
Iodine monofluoride energy transfer studies
[AD-A169791] N87-12652
CHEMICAL PROPERTIES
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630

Plasma assisted surface coating/modification processes: An emerging technology
[NASA-TM-88885] N87-12706

CHEMICAL REACTIONS
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12593
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941

CHEMICAL REACTORS
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] N87-13005

CHEMILUMINESCENCE
Iodine monofluoride energy transfer studies
[AD-A169781] N87-12852

CHINA
The Chinese guided missiles stride toward modernization
[AD-A169017] N87-12582

CHIPS (ELECTRONICS)
Compaction with automatic jog introduction
[AD-A169679] N87-12772
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170772] N87-12781
Heat transfer characteristics of simulated microelectronic chips under normal and enhanced conditions
[PB86-224425] N87-12904
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314

CHIPS (MEMORY DEVICES)
A VLSI-based high-performance raster image system
[AD-A169066] N87-12761
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175

CHROMIUM ALLOYS
Bainite in chromium-molybdenum steels
[DE86-011781] N87-12666
Gas tungsten arc welding of carbon steel to nickel-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012549] N87-12694

CHROMIUM STEELS
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12686
Gas tungsten arc welding of chromium-nickel steel to nickel-molybdenum-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012550] N87-12695

CIRCADIAN RHYTHMS
Sleepability and wakeability following sleep deprivation
[AD-A169578] N87-13130
Pharmacological resetting of the circadian sleep-wake cycle
[AD-A170804] N87-13137

CIRCUIT RELIABILITY
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175

CIRCUITS
Experimental verification of soliton theory using a microwave crossed-field amplifier
[AD-A170011] N87-12778

CIRCULAR CYLINDERS
Radar cross-section of damped cylinders and dielectric strips
[AD-A169027] N87-12726
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815
Cylindrical laser welder
[AD-D012398] N87-12850

CIRCULAR POLARIZATION
Investigations of long-period DQ Herculis star
N87-13364

CIRCULAR TUBES
Analysis of laminar flow heat transfer in uniform temperature circular tubes with tape inserts
[PB86-224763] N87-12826

CIRCULAR WAVEGUIDES
A spherical waveguide multiplexer-demultiplexer
N87-13265

CIRRUS CLOUDS
Experimental research on turbulence in upper-level tropospheric clouds N87-12962

CLADDING
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249

CLASSIFICATIONS
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-12181
Classification of N-type carbon stars
[AD-A171399] N87-13369

CLAYS
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS)
N87-12978
Use of digital Munsell color space to assist interpretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980

CLEAN FUELS
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706

CLEANING
Cleaning of aluminum alloy 5083
[DE86-012573] N87-12675

CLEAR AIR TURBULENCE
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071

CLEAVAGE
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by synchrotron topography
[DE86-002958] N87-13334

CLIMATE
Characterization of information requirements for studies of CO2 effects: Water resources, agriculture, fisheries, forests and human health
[DE86-012477] N87-13010
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
US Navy climatic study of the Caribbean Sea and Gulf of Mexico. Volume 2: East Caribbean Sea
[AD-A171487] N87-13112

CLIMATOLOGY
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107

CLINICAL MEDICINE
Biological and clinical dosimetry, July 1, 1964 to December 31, 1984
[DE86-006947] N87-13138

CLOSED ECOLOGICAL SYSTEMS
The ecology of microorganisms in a small closed system: Potential benefits and problems for space station
[NASA-TM-86563] N87-13166

CLOUD COVER
Third International Symposium on Tropical Meteorology N87-12948
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13036

CLOUD PHYSICS
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102
A sensitivity study of a one-dimensional time-dependent warm cumulus cloud model
[AD-A170141] N87-13109

CLOUDS
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169285] N87-12991

CLOUDS (METEOROLOGY)
Utilization of satellite cloud information to diagnose the energy state and transformations in extratropical cyclones N87-13051
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071
Time composite sounding N87-13083
Detection of rotating thunderstorms using satellite imagery N87-13085

COLLISIONS

Studies of humid continental haze during SPACE
N87-13089
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
Interactive information processing for NASA's mesoscale analysis and space sensor program
N87-13093
First meeting of the Working Group on the Shuttle Microwave Precipitation Radiometer (SMPR)
N87-13096
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13365

CLUMPS
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13325

CLUSTER ANALYSIS
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229

CMOS
Totally self-checking circuits and testable CMOS circuits
[AD-A169756] N87-12773
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331

COAL
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706

COALESCING
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585

COASTS
Meteorological summary of WATOX (western Atlantic Ocean experiment) 1985 research intensive, February-April
[PB86-226792] N87-13114

COAXIAL CABLES
Electric and magnetic field coupling through a braided-shield cable: Transfer admittance and transfer impedance
[AD-A171490] N87-12748

COBALT
Investigation of the effects of cobalt ions on epoxy properties
[NASA-TP-2639] N87-12680

COBALT ALLOYS
Ni-Co alloy plaque for cathode of Ni-Cd battery
[AD-D012375] N87-12769

COCKPITS
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729
Anthropometric handicaps in the construction of a helicopter cockpit — seats N87-13148

CODING
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933

COEFFICIENT OF FRICTION
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12663

COGNITION
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144

COGNITIVE PSYCHOLOGY
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157

COHERENT RADIATION
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865

COLD WATER
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131

COLLISION AVOIDANCE
Obstacle-warning radar for helicopters N87-13149

COLLISIONAL PLASMAS
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258

COLLISIONS
Study in molecular lasers
[AD-A169933] N87-12855

COLLOIDS
Electrokinetic properties of polymer colloids
[NASA-CR-179938] N87-12681
COMBINED STRESS
Using combined experiment/analysis to generate dynamic critical stress intensity data
[DE86-013578] N87-12945
COMBUSTION
Optical diagnostics for diesel engine applications
[DE86-010747] N87-12641
COMBUSTION CHAMBERS
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A168979] N87-12628
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
COMBUSTION PHYSICS
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
COMMAND GUIDANCE
Single-mode-fibers for fiberoptic-guided missiles: A comparison with graded-index multimode fibers
N87-13303
COMMERCE
Quality management: An annotated bibliography
[AD-A169616] N87-12912
COMMUNICATION CABLES
Fiber optics: A survivable and cost-effective transmission medium for terrestrial networks N87-13302
COMMUNICATION EQUIPMENT
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200
COMMUNICATION NETWORKS
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3958-PRE/876] N87-12720
Advanced teleprocessing systems
[AD-A170007] N87-12741
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200
Fiber optics: A survivable and cost-effective transmission medium for terrestrial networks N87-13302
COMMUNICATION SATELLITES
MILSTAR modeling survey
[AD-A169789] N87-12600
COMMUTATORS
Canonical quantization of gravity
[DE86-702615] N87-13372
COMPACTING
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12686
COMPARISON
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596
Comparison of tropical forest surveys
[DE86-011699] N87-12993
COMPENSATORS
Tracking servo compensator with rate aiding
[AD-D012388] N87-12735
COMPLEX COMPOUNDS
Dual temperature thermal storage with complex compounds
[DE86-011511] N87-13000
COMPONENT RELIABILITY
Investigation of the Challenger accident, volume 2
[GPO-64-548] N87-12586
COMPOSITE MATERIALS
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Stress effects on moisture transport in an epoxy resin and its composite
[AD-A169306] N87-12617
Quartz growth on X-seeds
[AD-D012269] N87-13315
COMPOSITE STRUCTURES
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12672
Improved anti-G suit
[AD-D012378] N87-13171
COMPRESSED AIR
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
COMPRESSIBLE FLOW
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12807
Free-Lagrangian hydrodynamics using massless tracer points
[DE86-012406] N87-12822
COMPRESSIBLE FLUIDS
Optical spectroscopy of dynamically compressed liquids
[AD-A169013] N87-12629
COMPRESSING
Optical spectroscopy of dynamically compressed liquids
[AD-A169013] N87-12629
COMPUTATION
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-86324] N87-12967
SOR (Successive Over-Relaxation) MGR (multigrid algorithm)(nu) experiments on the crystal multicomputer
[AD-A169929] N87-13187
Quantitative assessment of the effect of partial pivoting in sparse ordinary differential equation solvers
[DE86-012592] N87-13226
COMPUTATIONAL FLUID DYNAMICS
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3899] N87-12808
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821
COMPUTATIONAL GRIDS
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
SOR (Successive Over-Relaxation) MGR (multigrid algorithm)(nu) experiments on the crystal multicomputer
[AD-A169929] N87-13187
Some investigations into variable meshes for numerical solution of partial differential equations
[AD-A168977] N87-13206
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169855] N87-13214
COMPUTER AIDED DESIGN
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
Compaction with automatic jog introduction
[AD-A169679] N87-12772
Declarative descriptions for VLSI generators
[AD-A169952] N87-12777
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
Welding research in Scandinavia: An assessment
[AD-A169036] N87-12871
A software implementation of an interactive graphics system for three dimensional modeling and layout
[AD-A169264] N87-13183
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169855] N87-13214
COMPUTER AIDED MANUFACTURING
Welding research in Scandinavia: An assessment
[AD-A169036] N87-12871
COMPUTER ASSISTED INSTRUCTION
Catalog of Resources for Education in Ada (Trade name) and Software Engineering (CREASE), version 4.0
[AD-A169692] N87-13186
COMPUTER DESIGN
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
COMPUTER GRAPHICS
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-86324] N87-12967
Conversion of the NOLAPS (Navy Operational Local Atmospheric Prediction System) model to the HP9845
[AD-A169538] N87-13108
Utilization of impact dot matrix printers
[INPE-3991-RPE/518] N87-13173
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
A software implementation of an interactive graphics system for three dimensional modeling and layout
[AD-A169264] N87-13183
Using 3-dimensional graphics to visualize multivariate scientific data
[DE86-010788] N87-13195
Iterative methods for large linear and nonlinear least squares problems
[AD-A169028] N87-13209
COMPUTER INFORMATION SECURITY
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192
COMPUTER NETWORKS
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090
Interactive information processing for NASA's mesoscale analysis and space sensor program
N87-13093
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
COMPUTER PROGRAMMING
High frequency, high voltage MOSFET isolation amplifier
[AD-D012403] N87-12774
Catalog of Resources for Education in Ada (Trade name) and Software Engineering (CREASE), version 4.0
[AD-A169692] N87-13186
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192
Iterative methods for large linear and nonlinear least squares problems
[AD-A169028] N87-13209
COMPUTER PROGRAMS
Computer programs for electromagnetic scattering from a slotted TM cylindrical conductor by the pseudo-image method
[AD-A169016] N87-12725
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS)
N87-12978
LAMPS software and mesoscale prediction studies
N87-13076
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178
Maintaining LU factors of a general sparse matrix
[AD-A169255] N87-13248
Temperature compensation in the 2:17 type magnet s
[AD-A169487] N87-13250
COMPUTER STORAGE DEVICES
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
Distributed name servers: Naming and caching in large distributed computing environments
[AD-A169225] N87-13201
COMPUTER SYSTEMS DESIGN
Interpretive model for a concurrency method
[DE86-012743] N87-13197
COMPUTER TECHNIQUES
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12834
Integrating computer vision with a robot arm system
[AD-A171278] N87-12864
High-resolution analysis of eye movements
[AD-A170779] N87-13136
Yield and performance enhancement through redundancy in VLSI and WSI multi-processor systems
[AD-A169930] N87-13174
Single-phase method for quadratic programming
[DE86-012156] N87-13194
COMPUTER VISION
Integrating computer vision with a robot arm system
[AD-A171278] N87-12864

COMPUTERIZED SIMULATION
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12596
MILSTAR modeling survey
[AD-A169789] N87-12600
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
Development of an inexpensive, high resolution positron multiwire proportional counter
[DE86-011576] N87-12841
Mechanical interactions of rough surfaces
[DE86-010886] N87-12901
Linear harmonic analysis of free-piston Stirling engines
[DE86-012451] N87-12903
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-88324] N87-12967
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution: remote sensing N87-12973
Photovoltaic Concentrator Technology Project, Fourteenth Project Integration Meeting, June 10-11, 1986
[DE86-012051] N87-13006
Atmospheric illumination and shadows, revision 1
[DE86-010971] N87-13039
Numerical simulation of convective response to mesoscale forcing N87-13081
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
Tool to develop real time simulation systems
[INPE-3979-TDL/233] N87-13179
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203
Two-dimensional dynamics of the plasma Wakefield accelerator
[DE86-012382] N87-13312

COMPUTERS
Directory of range data conversion and processing system, revision
[AD-A169629] N87-12578
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715

CONCURRENT PROCESSING
Interpretive model for a concurrency method
[DE86-012743] N87-13197

CONDUCTIVE HEAT TRANSFER
An analysis of shear band development incorporating heat conduction
[AD-A169972] N87-12926

CONFERENCES
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop
[NASA-CR-179924] N87-12968
Proceedings of the Solar Thermal Technology Conference
[DE86-011703] N87-13002
Middle Atmosphere Program. Handbook for MAP, volume 21
[NASA-CR-178893] N87-13015
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-6, 1984 N87-13016
Proceedings of the Workshop on Atmospheric Tides, Prague, Czechoslovakia, August 14, 1985 N87-13017
Minutes of MAP/WINE experimenters meeting, Prague, Czechoslovakia, August 13, 1985 N87-13018
Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems
[DGLR-85-04] N87-13146
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1986
[AD-A169473] N87-13246
Contributions to the 18th International Cosmic Ray Conference
[ATR-86(9558)-11] N87-13389

CONFIDENCE LIMITS
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236

CONFINEMENT
Tara vacuum system
[DE86-011873] N87-13311

CONGRESSIONAL REPORTS
National Commission on Space report
[GPO-63-143] N87-12574
Investigation of the Challenger accident, volume 2
[GPO-64-548] N87-12586
NASA's quality assurance program
[GPO-63-142] N87-12909
Department of Housing and Urban Development-independent agencies appropriations for 1987, part 7
[GPO-61-970] N87-13357

CONICAL SHELLS
Dynamic analysis of anisotropic conical shells
[EPM/RT-86-36] N87-12916
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918

CONJUGATION
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696

CONNECTORS
Light socket removal tool
[AD-D012368] N87-12710

CONSTITUTIVE EQUATIONS
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
Data requirements to model creep in 9Cr-1Mo-V steel
[DE86-011754] N87-12944

CONSTRUCTION
Beam steering mirror construction
[AD-D012399] N87-13268

CONSTRUCTION MATERIALS
Periodic heat transfer through an inhomogeneous medium
[DE86-702988] N87-12825

CONTACT RESISTANCE
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596

CONTAINMENT
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943

CONTAMINATION
Effects of inertia weld parameters and contamination on weld flash shape and on joint strength: An improved study
[DE86-013074] N87-12904

CONTINUITY
An intuitive approach to geometric continuity for parametric curves and surfaces
[AD-A169654] N87-13211

CONTINUUM MECHANICS
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12684
Surface green function matching for a three-dimensional non-local continuum
[DE86-702647] N87-13341
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368

CONTRACTORS
Investigation of the Challenger accident, volume 2
[GPO-64-548] N87-12586
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169165] N87-13350

CONTRAROTATING PROPELLERS
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252

CONTROL BOARDS
Ergonomic requirements for the design of control rooms. Evaluation method N87-13158

CONTROL SIMULATION
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/216] N87-13151

CONTROL STABILITY
Feedback system design with an uncertain plant
[NASA-CR-176887] N87-13243

CONTROL SYSTEMS DESIGN
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
Feedback system design with an uncertain plant
[NASA-CR-176887] N87-13243

CONTROL VALVES
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170

CONTROLLERS
Flight model discharge system
[AD-A169423] N87-12571
Problems in integrated digital networks
[AD-A170442] N87-12744
Aircraft battery state of charge and charge control system
[AD-A169411] N87-12766
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
The evaluation of a number of prototypes for the free-tip rotor constant-moment controller
[NASA-TM-86664] N87-12869
Feedback system design with an uncertain plant
[NASA-CR-176887] N87-13243

CONVECTION
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
Theoretical and experimental studies of baroclinic processes N87-13044
The use of satellite data in understanding and predicting convective and large-scale dynamical processes N87-13049
Optical characteristics of lightning and thunderstorm currents N87-13061
Response of the mesoscale atmosphere to diabatic heating N87-13069
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
LAMPS software and mesoscale prediction studies N87-13076
Mesoscale research activities with the LAMPS model N87-13078
Numerical simulation of convective response to mesoscale forcing N87-13081
A summary of research on mesoscale energetics of severe storm environments N87-13082

CONVECTION CLOUDS
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220357] N87-13014
Remote sensing of severe convective storms N87-13075

CONVECTION CURRENTS
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031

CONVECTIVE FLOW
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12614
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12817
Convective surface layers: Influence of the boundary layer depth N87-13041

CONVECTIVE HEAT TRANSFER
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12817
Effect of convection on weld pool shape and microstructure
[AD-A170488] N87-12883

CONVERGENCE
HOMPACK: A suite of codes for globally convergent homotopy algorithms
[DE86-011644] N87-13196
The h-p version of the finite element method with quasiuniform meshes
[AD-A170144] N87-13222
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230

Extreme values of birth and death processes and queues
[AD-A169932] N87-13235
COOLING
The analysis of a transistor cap as a heat dissipator
[AD-A171398] N87-12786
COORDINATE TRANSFORMATIONS
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12553
COORDINATES
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
COPOLYMERS
Investigation of the effects of short chain processing additives on polymers
[NASA-TM-89023] N87-12614
Physical characteristics of diblock polyacetylene copolymers: Processability-conductivity correlation
[DE86-011218] N87-12695
COPPER
Effect of strain and strain rate on residual microstructures in copper
[DE86-007361] N87-12659
Effect of residual strain on twinning in shock-loaded copper
[DE86-007362] N87-12660
CORIOLIS EFFECT
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045
CORNER FLOW
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
CORONAL HOLES
Magnetic field re-arrangement after prominence eruption
[DE86-012393] N87-13382
CORONAL LOOPS
Equilibrium configuration of coronal loops
[DE86-702711] N87-13384
CORRELATION
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A168971] N87-13026
Deep convection in mesoscale convective systems
N87-13055
On reduction of dimensionality under multivariate regression and canonical correlation models
[AD-A170025] N87-13238
CORROSION
Initiation of pitting corrosion in martensitic stainless steels
[DE86-007627] N87-12661
CORROSION PREVENTION
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652
Zinc/air cell cathode
[AD-D012425] N87-12780
CORROSION RESISTANCE
Initiation of pitting corrosion in martensitic stainless steels
[DE86-007627] N87-12661
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013754] N87-12802
COSMIC RAY SHOWERS
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396
COSMIC RAYS
Contributions to the 18th International Cosmic Ray Conference
[ATR-86(9558)-11] N87-13389
The ultraheavy cosmic rays: Propagation and selective acceleration N87-13390
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances
N87-13392
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
Observations on the Stanford 4800 KG gravity wave detector with a cosmic ray monitor N87-13399
COSMOLOGY
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
Astro-particle-physics
[DE86-702946] N87-13373
COST ANALYSIS
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169185] N87-13350
COST ESTIMATES
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169185] N87-13350
COSTS
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
COUETTE FLOW
Analysis of the nonlinear stability of circular Couette flow
[AD-A168951] N87-12811
COUNTING
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169278] N87-13144
COUNTING CIRCUITS
Totally self-checking circuits and testable CMOS circuits
[AD-A169758] N87-12773
COUPLING
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12553
Electric and magnetic field coupling through a braided-shield cable: Transfer admittance and transfer impedance
[AD-A171490] N87-12748
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796
Donor-acceptor one step energy transfer via exchange coupling on a fractal lattice
[AD-A169843] N87-13325
COUPLING COEFFICIENTS
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
COVARIANCE
A multivariate extension of Hoeffding's lemma
[AD-A170170] N87-13239
CRAB NEBULA
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396
CRACK PROPAGATION
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169639] N87-12620
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12658
Application of hydrogen embrittlement models to the crack growth behavior of fusion reactor materials
[DE86-011614] N87-12671
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12676
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943
Using combined experiment/analysis to generate dynamic critical stress intensity data
[DE86-013578] N87-12945
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002968] N87-13334
CRACKING (FRACTURING)
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
CRACKS
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
Computation of the amplitude of stress singular terms for cracks and reentrant corners
[AD-A169796] N87-12938
CRASH INJURIES
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
CRASH LANDING
Aircraft accident/incident summary reports: Erie, Pennsylvania, October 14, 1984; Albuquerque, New Mexico, February 11, 1985
[PB86-910407] N87-12549
Aircraft accident report: Bar Harbor Airlines Flight 1808, Beech BE-99, N300WP, Auburn-Lewiston Municipal Airport, Auburn, Maine, August 25, 1985
[PB86-910408] N87-12550
CREEP PROPERTIES
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Data requirements to model creep in 9Cr-1Mo-V steel
[DE86-011754] N87-12944
CREEP TESTS
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
CRITERIA
Basic conceptions for the evaluation of man machine systems N87-13161
CRITICAL POINT
Vapour pressures and critical points of liquids. Part 3A: C6 to C10 alkylbenzenes
[ESDU-86012-PT-3A] N87-12625
CROP INVENTORIES
Crop yield modeling for climate impact studies. Part 1: Reasoning and results
[INPE-3967-PRE/982-PT-1] N87-12961
CROSS FLOW
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611
CROSSED FIELDS
Experimental verification of soliton theory using a microwave crossed-field amplifier
[AD-A170011] N87-12778
CROSSLINKING
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169038] N87-12683
CRUISING FLIGHT
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252
CRYOGENIC COOLING
Cryogenic wound rotor for lightweight, high voltage generators
[AD-D012370] N87-12766
CRYOGENIC EQUIPMENT
Observations on the Stanford 4800 KG gravity wave detector with a cosmic ray monitor N87-13399
CRYOGENICS
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013636] N87-12714
Development of low-temperature transistor modules to improve the MSFC mid-infrared array
[NASA-TM-86566] N87-12756
CRYSTAL DEFECTS
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941

Search for far infrared radiation from optically and acoustically pumped defect modes
[AD-A169159] N87-13319
Structural features at the Si-SiO2 interface
[DE86-012947] N87-13339
CRYSTAL DISLOCATIONS
Quartz growth on X-seeds
[AD-D012269] N87-13315
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002966] N87-13334
CRYSTAL GROWTH
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010706] N87-13004
Quartz growth on X-seeds
[AD-D012269] N87-13315
Incremental quench research
[AD-A169980] N87-13317
CRYSTAL LATTICES
Mossebauer-Bormann superradiance
[DE86-012373] N87-12866
Surface green function matching for a three-dimensional non-local continuum
[DE86-702647] N87-13341
CRYSTAL OPTICS
Phase conjugate optics and picosecond optoelectronics
[AD-A169180] N87-13265
CRYSTAL STRUCTURE
Shifts in shuttle SRM performance because of ammonium perchlorate crystal shape on missions 51-I/J and 61-A/B
[NASA-TM-86561] N87-12607
Neutron diffraction studies of some rare earth-transition metal deuterides
[AD-A169995] N87-12648
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
Densification of graphites by irradiation
[DE86-010026] N87-12698
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13323
Epitaxial crystallization and epitaxial polymerization as tools for molecular engineering
[AD-A171506] N87-13333
Electron diffraction analysis of the pentagonal arrangement of grains found in CVD pure Ni films
[DE86-009023] N87-13336
Surface and adsorption-like states within the nearly free electron approximation
[DE86-702651] N87-13342
CRYSTAL SURFACES
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169082] N87-12632
CRYSTALLIZATION
Epitaxial crystallization and epitaxial polymerization as tools for molecular engineering
[AD-A171506] N87-13333
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702646] N87-13340
CRYSTALS
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169805] N87-13324
Use of Wannier function in the calculations of band structure of covalent crystals
[DE86-702668] N87-13344
CUMULUS CLOUDS
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220357] N87-13014
A sensitivity study of a one-dimensional time-dependent warm cumulus cloud model
[AD-A170141] N87-13109
CURRENT SHEETS
The current-voltage relationship in auroral current sheets
[AD-A169074] N87-13028
CURVES (GEOMETRY)
HOMPACK: A suite of codes for globally convergent homotopy algorithms
[DE86-011844] N87-13198
An intuitive approach to geometric continuity for parametric curves and surfaces
[AD-A169654] N87-13211
CYCLONES
Meteorological effects of geotectonic phenomena hypothesized N87-12947
Summary of 1986 Atlantic tropical cyclone activity and verification of author's seasonal forecast N87-13097
CYCLOTRON RESONANCE DEVICES
A 60 GHz gyrotron development program
[DE86-012488] N87-12791
CYLINDRICAL BODIES
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89050] N87-12538
Density and electrostatic potential distribution around a cylindrical satellite
[INPE-3953-NTE/258] N87-12595
Axial detonator for simultaneous ignition of multiple HE points
[DE86-011878] N87-12643
Computer programs for electromagnetic scattering from a slotted TM cylindrical conductor by the pseudo-image method
[AD-A169016] N87-12725
Low Q spin-up from rest
[AD-A169106] N87-12813
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
CYLINDRICAL SHELLS
Cylindrical laser welder
[AD-D012398] N87-12850
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
Free vibration of axisymmetric and beam-like cylindrical shells, partially filled with liquid
[EPM/RT-86-35] N87-12920
CZOCHRALSKI METHOD
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320

D

DAMAGE ASSESSMENT
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
DAMPERS (VALVES)
Multiple rate shock isolator damping valve
[AD-D012394] N87-12879
DAMPING
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-12602
Radar cross-section of damped cylinders and dielectric strips
[AD-A169027] N87-12726
DAMPING TESTS
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
DATA ACQUISITION
An approach to design knowledge capture for the space station
[NASA-TM-89272] N87-12597
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/259] N87-12963
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3982-TDL/234] N87-12990
The meteorological interactive data display system N87-13091
DATA BASE MANAGEMENT SYSTEMS
Data tagging in the Energy Data Base
[DE86-010621] N87-13355
DATA BASES
Introduction to the theory of nested transactions
[AD-A171426] N87-13191
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
Further results on interpolation searching of databases
[DE86-012822] N87-13356
DATA COMPRESSION
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
DATA CORRELATION
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Coordinated study of the behavior of the middle atmosphere in winter: Monthly mean comparisons of satellite and radiosonde data and derived quantities N87-13019
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
DATA LINKS
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169798] N87-12554
Performance of RF fiber optic links N87-13301
A hybrid transmission scheme on single mode fibers for tactical communications N87-13306
DATA MANAGEMENT
Federal information systems management: Problems, solutions and more problems
[AD-A171366] N87-13353
DATA PROCESSING
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta e squared))
[NASA-TM-87731] N87-12566
A prototype maintenance expert system for the CH-47 flight control hydraulic system
[AD-A169019] N87-12569
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599
Pulse Code Modulation (PCM) data storage and analysis using a microcomputer
[NASA-TP-2629] N87-12718
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/259] N87-12963
ERS-1 SAR data processing
[NASA-CR-179913] N87-12965
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features N87-12972
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution remote sensing N87-12973
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Interactive information processing for NASA's mesoscale analysis and space sensor program N87-13093
NOSL experiment support
[NASA-CR-178947] N87-13140
Tool to develop real time simulation systems
[INPE-3979-TDL/233] N87-13179
Design and analysis of experiments and more realistic techniques for data analysis
[AD-A169921] N87-13228
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242
Space plasma research
[NASA-CR-178965] N87-13307
Electronic forms. How close to value-added processing
[DE86-010484] N87-13354
DATA PROCESSING EQUIPMENT
Directory of range data conversion and processing system, revision
[AD-A169629] N87-12578
DATA REDUCTION
Directory of range data conversion and processing system, revision
[AD-A169629] N87-12578
Pulse Code Modulation (PCM) data storage and analysis using a microcomputer
[NASA-TP-2629] N87-12718
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
Zero-crossings analysis
[AD-A169937] N87-13218
Design and analysis of experiments and more realistic techniques for data analysis
[AD-A169921] N87-13228
DATA RETRIEVAL
Improved satellite retrievals and mesoscale moisture variability N87-13087

Further results on interpolation searching of databases
[DE86-012622] N87-13358

DATA STORAGE
An approach to design knowledge capture for the space station
[NASA-TM-89272] N87-12597
Pulse Code Modulation (PCM) data storage and analysis using a microcomputer
[NASA-TP-2629] N87-12718
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3982-TDL/234] N87-12990

DATA STRUCTURES
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198

DATA TRANSMISSION
SPRINT 3: Serial-Parallel Remote Interface System development report
[DE86-010590] N87-13176

DEBRIS
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603

DECISION MAKING
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203
Application of a network associative scene analysis model
[INPE-3945-PRE/967] N87-13244

DEFECTS
Effect of convection on weld pool shape and microstructure
[AD-A170488] N87-12880

DEFENSE INDUSTRY
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715

DEFENSE PROGRAM
Possible military applications of stratospheric airship discussed N87-12716
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200

DEFLAGRATION
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703

DEFLECTION
A new and efficient formulation for finite element analysis of thin shell structures undergoing small and large deflection N87-12913

DEFORESTATION
Comparison of tropical forest surveys
[DE86-011699] N87-12993

DEFORMATION
Effect of strain and strain rate on residual microstructures in copper
[DE86-007361] N87-12889
Mechanics of metal forming
[DE86-012414] N87-12673
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12889
A study of the mechanism of dynamic ductile fracture of two-phase materials
[AD-A169966] N87-12925

DEGREES OF FREEDOM
The effect of coupling in an inertial navigation platform stabilized system made up of three single degree-of-freedom gyroscopes
[AD-A169110] N87-12553
A finite element method for localized failure analysis
[AD-A169117] N87-12930

DEICING
A heater made from graphite composite material for potential deicing application
[NASA-TM-88888] N87-12559

DELAY
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178

DEMODULATION
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
Progress in optical fiber sensors N87-13274

DEMULTIPLEXING
A spherical waveguide multiplexer-demultiplexer N87-13266

DENDRITIC CRYSTALS
Incremental quench research
[AD-A169980] N87-13317

DENSIFICATION
Densification of graphites by irradiation
[DE86-010026] N87-12896

DENSITY (NUMBER/VOLUME)
Calculated versus experimental charge density distribution of Be metal
[AD-A169924] N87-13254

DENSITY DISTRIBUTION
Calculated versus experimental charge density distribution of Be metal
[AD-A169924] N87-13254

DENSITY MEASUREMENT
Metal thickness measurements using radiography
[AD-D012373] N87-12832

DEPOSITION
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A169963] N87-13316

DESERTIFICATION
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Desertification: Global ecological problem N87-12950

DESERTS
AIS spectra of desert shrub canopies N87-12987

DESIGN ANALYSIS
Viewport concept for space station modules
[NASA-TM-88559] N87-12592
An approach to design knowledge capture for the space station
[NASA-TM-89272] N87-12597
Ergonomic requirements for the design of control rooms. Evaluation method N87-13158
Design and analysis of experiments and more realistic techniques for data analysis
[AD-A169921] N87-13228

DETECTION
Remote sensing to detect ecological impacts associated with acid deposition
[DE86-011640] N87-12992
Severe storm electricity N87-13056
Storm severity detection (RF) N87-13057
Lightning mapper and the future N87-13059
Remote observations of severe storms N87-13065
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13084
Detection of rotating thunderstorms using satellite imagery N87-13085
A rule-based pattern matching system for the recognition of three-dimensional line drawn objects: A foundation for video tracking
[AD-A170701] N87-13190
Observations on the Stanford 4800 KG gravity wave detector with a cosmic ray monitor N87-13399

DETONATION
Detonation cellular structure and image proces
[DE86-008467] N87-12819
Study of numerical solution methods for two-phase flows
[DE86-012285] N87-12821

DETONATORS
Axial detonator for simultaneous ignition of multiple HE points
[DE86-011979] N87-12643
Anvil detonator: A 300EC-stable, hot-wire-ignited, nonprimary-explosive device
[DE86-013635] N87-12707

DEUTERIDES
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12944
Neutron diffraction studies of some rare earth-transition metal deuterides
[AD-A169985] N87-12948

DEUTERIUM
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12944

DIAGNOSIS
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567

DIAMONDS
Use of Wannier function in the calculations of band structure of covalent crystals
[DE86-702668] N87-13344

DIATOMIC MOLECULES
Study in molecular lasers
[AD-A169933] N87-12855

DICTIONARIES
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169675] N87-13352

DIELECTRIC PROPERTIES
New ultra low permittivity composites for use in ceramic packaging of GaAs integrated circuits
[AD-A169877] N87-12758

DIELECTRICS
Radar cross-section of damped cylinders and dielectric strips
[AD-A169027] N87-12726
Dielectric antennas for millimeter-wave applications
[AD-A169685] N87-12739
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045

DIENES
Vapour pressures and critical points of liquids. Part 2C: Alkadienes and alkynes
[ESDU-86001-PT-2C] N87-12624

DIESEL ENGINES
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A169979] N87-12828
Optical diagnostics for diesel engine applications
[DE86-010747] N87-12841
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A168048] N87-12870

DIESEL FUELS
Optical diagnostics for diesel engine applications
[DE86-010747] N87-12841

DIFFERENTIAL EQUATIONS
The continuous projective sumt method for convex programming — sequential unconstrained minimization techniques
[AD-A169647] N87-13185
Performance analysis of some numerical algorithms in the resolution of ODEs artificial satellite problems
[INPE-3996-PRE/995] N87-13206
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216

DIFFRACTION LIMITED CAMERAS
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
Space infrared telescope facility wide field and diffraction limited array camera (IRAC)
[NASA-CR-177041] N87-13362

DIFFUSION
Transport and relaxation processes in supercritical fluids
[DE86-007947] N87-12838
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12889
Generalization of one-dimensional solute transport: A stochastic-convective flow conceptualization
[DE86-011117] N87-12820
Stress assisted diffusion in elastic and viscoelastic materials
[AD-A169296] N87-12932
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337

DIFFUSION ELECTRODES
Coordinated research program in pulsed power physics
[AD-A169113] N87-12792

DIGITAL COMPUTERS
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090

DIGITAL DATA
SPRINT 3: Serial-Parallel Remote Interface System development report
[DE86-010590] N87-13176

DIGITAL SIMULATION
Determination of the load and stress of a cockpit crew during aircraft piloting using task networks and the simulation language SAINT N87-13150
DIGITAL SYSTEMS
Phased arrays 1985 symposium: Proceedings
[AD-A169316] N87-12732
Problems in integrated digital networks
[AD-A170442] N87-12744
DIGITAL TECHNIQUES
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
DIGITAL TO ANALOG CONVERTERS
Unique mechanization to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
DIPHENYL COMPOUNDS
Methods for the syntheses of mono-, di-, tri- and tetranitro derivatives of diphenylamine
[WSRL-0436-TR] N87-12702
DIRECTION FINDING
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169788] N87-12554
DIRECTORIES
Directory of range data conversion and processing system, revision
[AD-A169629] N87-12576
DIRICHLET PROBLEM
The h-p version of the finite element method with quasiuniform meshes
[AD-A170144] N87-13222
DISCRIMINANT ANALYSIS (STATISTICS)
Pattern recognition based on scale invariant discriminant functions
[AD-A170809] N87-13241
DISCRIMINATION
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135
DISPLACEMENT
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
DISPLAY DEVICES
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
Simulation of CIFF (Centralized IFF) remote control displays
[AD-A170387] N87-12742
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170852] N87-12747
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
The meteorological interactive data display system N87-13091
A design study for a three-dimensional display computer terminal for meteorological information N87-13092
Human performance aspects of small screen displays: A literature review revealing the lack of specific research
[AD-A170680] N87-13172
Utilization of impact dot matrix printers
[INPE-3991-RPE/518] N87-13173
DISSOCIATION
Study in molecular lasers
[AD-A169933] N87-12855
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169805] N87-13324
DISTRIBUTED PROCESSING
Advanced selfprocessing systems
[AD-A170007] N87-12741
Distributed name servers: Naming and caching in large distributed computing environments
[AD-A169225] N87-13201
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
DISTRIBUTION (PROPERTY)
First meeting of the Working Group on the Shuttle Microwave Precipitation Radiometer (SMPR) N87-13096
DISTRIBUTION FUNCTIONS
Note on a characterization of exponential distributions
[AD-A169886] N87-13215
A multivariate extension of Hoeffding's lemma
[AD-A170170] N87-13239
DIURNAL VARIATIONS
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/985] N87-12964
DMSP SATELLITES
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
DOCUMENTS
Electronic forms. How close to value-added processing
[DE86-010484] N87-13354
DONOR MATERIALS
Donor-acceptor one step energy transfer via exchange coupling on a fractal lattice
[AD-A169643] N87-13325
DOPED CRYSTALS
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002968] N87-13334
DOPPLER EFFECT
Doppler effect laser velocity measuring system
[AD-D012401] N87-12854
DOPPLER RADAR
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
Mobile intercept of storms N87-13064
Airborne Doppler measurements of the central California extended sea breeze N87-13066
Analysis of Doppler lidar data N87-13067
Airborne Doppler lidar activities N87-13068
Doppler wind profile experiment N87-13094
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110
DOSIMETERS
Biological and clinical dosimetry, July 1, 1984 to December 31, 1984
[DE86-006947] N87-13138
DRAG
Simplified forms of performance equations. Addendum A: Effect on aeroplane level speed of small changes in thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-12556
DRAG REDUCTION
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543
DRIFT RATE
Closed loop fiber optic gyro N87-13277
DROP TESTS
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
DROPS (LIQUIDS)
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12823
DUCTED BODIES
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
DUCTILITY
A study of the mechanism of dynamic ductile fracture of two-phase materials
[AD-A168966] N87-12925
DUMMIES
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
DUST
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12807
DYNAMIC CHARACTERISTICS
Fragmentation dynamics of energetic materials
[AD-A168925] N87-12682
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
DYNAMIC LOADS
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
DYNAMIC RESPONSE
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169363] N87-12933
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
DYNAMIC STABILITY
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
DYNAMIC STRUCTURAL ANALYSIS
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
DYNAMICAL SYSTEMS
A procedure for attitude determination of artificial satellite: utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
Constructive and operational characteristics of a synchronous induction motor
[INPE-3976-RPE/517] N87-12755

E

E REGION
Effect of pulsating auroras on frequency-time characteristics of radio signals reflected from auroral ionosphere N87-12954
EARTH ATMOSPHERE
The space station millimeter facility
[AD-A169983] N87-12604
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
Atmospheric illumination and shadows, revision 1
[DE86-010971] N87-13039
Characterization of the gamma radiation in space and in the atmosphere
[DE86-013445] N87-13397
EARTH CRUST
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
EARTH IONOSPHERE
Transverse resonances of Earth-ionosphere wave guide in auroral region N87-12956
The current-voltage relationship in auroral current sheets
[AD-A169074] N87-13028
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
EARTH MANTLE
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Meteorological effects of geotectonic phenomena hypothesized N87-12947
EARTH OBSERVATIONS (FROM SPACE)
Study of satellite systems to monitor Earth's radiation budget
[CAP-420-071] N87-12994
Remote observations of severe storms N87-13065
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071
EARTH ORBITS
Vector analysis and satellite footprints
[AD-A169832] N87-12576
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3895-PRE/937] N87-12590
EARTH PLANETARY STRUCTURE
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
Earth sciences research in the Civil Space Program
[PB86-232014] N87-12995
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A168971] N87-13026
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034

EARTHQUAKES
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030
ECHO SOUNDING
The Gulf Stream dynamics experiment. Inverted echo sounder data report for the June 1984 to May 1985 deployment period
[AD-A170758] N87-13121
ECOLOGY
Patterns of vegetation in the Owens Valley, California N87-12986
ECONOMETRICS
On reduction of dimensionality under multivariate regression and canonical correlation models
[AD-A170025] N87-13238
ECOSYSTEMS
Evaluating ecosystem response to toxicant stress: a state space approach
[DE86-011777] N87-13009
Direct effects of atmospheric CO2 enrichment on plants and ecosystems: A bibliography with abstracts
[DE86-013525] N87-13012
EDUCATION
In retrospect: The impact of research production in the area of remote sensing
[INPE-3987-NTE/261] N87-12988
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13361
EFFICIENCY
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13266
EIGENVALUES
Low Q spin-up from rest
[AD-A169106] N87-12813
EIGENVECTORS
Eigenvectors of graphs
[AD-A170562] N87-13223
EJECTA
X-ray emission from supernova remnants N87-13398
EJECTION
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126
EL NINO
On the Walker circulation of 1983-84
[INPE-3952-PRE/971] N87-13118
ELASTIC BODIES
Computation of the amplitude of stress singular terms for cracks and reentrant corners
[AD-A169796] N87-12936
ELASTIC CYLINDERS
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170493] N87-12937
ELASTIC PROPERTIES
Quantitative non-destructive evaluation of composite materials based on ultrasonic wave propagation
[NASA-CR-179831] N87-12613
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169839] N87-12620
Factors influencing elastic stresses in double cantilever beam specimens
[NASA-TM-89033] N87-12922
Stress assisted diffusion in elastic and viscoelastic materials
[AD-A169296] N87-12932
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169655] N87-13214
ELASTOMERS
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169036] N87-12683
ELECTRIC ARCS
Population inversions in laser-initiated vacuum arcs
[AD-A170611] N87-12859
ELECTRIC BATTERIES
Zinc/air cell cathode
[AD-D012425] N87-12780
Sodium-sulfur battery systems development
[DE86-011424] N87-12788
Zinc/nickel oxide battery membrane separator studies
[DE86-012824] N87-12793
Feasibility study of a new zinc-air battery concept using flowing alkaline electrolyte
[DE86-013461] N87-12796
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013754] N87-12802
Development of regenerable energy storage for space multimegawatt applications
[DE86-011070] N87-12998
ELECTRIC CHARGE
Metrics of closed world of Friedmann, agitated by electric charge (towards a theory electromagnetic Friedmann's)
[AD-A168981] N87-12723
Calculated versus experimental charge density distribution of Be metal
[AD-A168924] N87-13254
FET charge sensor and voltage probe
[NASA-CASE-NPO-16045-1] N87-13313
ELECTRIC COILS
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
ELECTRIC CONDUCTORS
Development of a numerical procedure to treat wires attached to arbitrarily shaped conducting bodies
[AD-A169384] N87-12764
ELECTRIC CURRENT
A heater made from graphite composite material for potential deicing application
[NASA-TM-88888] N87-12559
Nuclear reaction analysis of hydrogen in metals
[AD-A169032] N87-12649
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
High frequency, high voltage MOSFET isolation amplifier
[AD-D012403] N87-12774
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796
Optical fiber sensors for the measurement of pulsed electric currents N87-13281
ELECTRIC DISCHARGES
Coordinated research program in pulsed power physics
[AD-A169113] N87-12762
Preliminary material testing of ceramic and wood
[AD-A169557] N87-12771
ELECTRIC FIELDS
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/988] N87-12843
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012384] N87-12864
Solar control of geophysical phenomena N87-12953
The current-voltage relationship in auroral current sheets
[AD-A169074] N87-13028
Two-dimensional dynamics of the plasma Wakefield accelerator
[DE86-012382] N87-13312
Large-scale electric fields resulting from magnetic reconnection in the corona
[DE86-012391] N87-13383
ELECTRIC GENERATORS
Compact reactor/ORC power source
[DE86-011252] N87-13260
ELECTRIC MOTOR VEHICLES
Performance of advanced lead acid batteries for electric vehicles
[DE85-011476] N87-12801
ELECTRIC POTENTIAL
FET charge sensor and voltage probe
[NASA-CASE-NPO-16045-1] N87-13313
ELECTRIC PULSES
Nanosecond spark gap switching measurements
[DE86-012279] N87-12790
Optical fiber sensors for the measurement of pulsed electric currents N87-13281
ELECTRIC SWITCHES
Coordinated research program in pulsed power physics
[AD-A169113] N87-12762
Interrupt control switch interface system
[AD-D012414] N87-12776
ELECTRICAL ENGINEERING
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
ELECTRICAL IMPEDANCE
Electric and magnetic field coupling through a braided-shield cable: Transfer admittance and transfer impedance
[AD-A171490] N87-12748
Development of a numerical procedure to treat wires attached to arbitrarily shaped conducting bodies
[AD-A169384] N87-12764
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12799
Quantum 1/F noise in solid state double devices, in particular Hg(1-x)CrbxTe diodes
[AD-A171436] N87-13332
ELECTRICAL INSULATION
Preliminary material testing of ceramic and wood
[AD-A169557] N87-12771
ELECTRICAL MEASUREMENT
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
ELECTRICAL PROPERTIES
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169036] N87-12683
ELECTRICAL RESISTIVITY
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Finite mean-free-paths and the electrical resistivity of liquid simple metals and binary alloys
[DE86-702682] N87-12678
Physical characteristics of diblock polyacetylene copolymers: Processability-conductivity correlation
[DE86-011218] N87-12695
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696
In-line determination of presence of liquid phase moisture in sealed IC packages
[AD-D012408] N87-12775
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702646] N87-13340
ELECTRO-OPTICS
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779
Direct writing of microstructures for solid-state electronics
[AD-A170637] N87-12783
High power semiconductor laser sources
[AD-A168900] N87-12844
Phase conjugate optics and picosecond optoelectronics
[AD-A169180] N87-13265
Optical processing
[AD-A169882] N87-13269
Method and apparatus for rapid optical phasing
[AD-D012412] N87-13270
Feasibility of making coherent fiber-optic arrays from fused silica
[AD-A170873] N87-13271
Optoelectronic broadband switching for communications and signal processing N87-13294
Picosecond nonlinear resonant interactions in semiconductors
[AD-A169992] N87-13327
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-13328
ELECTROCATALYSTS
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996
ELECTROCHEMICAL CORROSION
Ni-Co alloy plaque for cathode of Ni-Cd battery
[AD-D012375] N87-12769
ELECTROCHEMICAL OXIDATION
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169082] N87-12632
ELECTROCHEMISTRY
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
Fluids in contact with a hard surface: University of the bridge functions for the density profile
[AD-A168945] N87-13308
ELECTRODELESS DISCHARGES
Very high efficacy electrodeless high intensity discharge lamps
[DE86-013760] N87-12803

ELECTRODES
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169061] N87-12631
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
Aircraft battery state of charge and charge control system
[AD-A169411] N87-12786
Feasibility study of a new zinc-air battery concept using flowing alkaline electrolyte
[DE86-013461] N87-12798
ELECTRODYNAMICS
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
ELECTROENCEPHALOGRAPHY
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144
ELECTROKINETICS
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
ELECTROLYSIS
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
ELECTROLYTES
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169061] N87-12631
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
Zinc/air cell cathode
[AD-D012425] N87-12780
Feasibility study of a new zinc-air battery concept using flowing alkaline electrolyte
[DE86-013461] N87-12798
ELECTROMAGNETIC ABSORPTION
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13385
ELECTROMAGNETIC FIELDS
Physical interaction of 1-Hz to 100 kHz electric and magnetic fields with living organisms
[DE86-012323] N87-13139
ELECTROMAGNETIC INTERFERENCE
Optical fiber sensors for the measurement of pulsed electric currents N87-13281
ELECTROMAGNETIC NOISE
Regular noise background in VLF-radiation and world thunderstorm centers N87-12957
A study of methods of phase noise reduction of semiconductor lasers for sensor applications N87-13286
ELECTROMAGNETIC PROPERTIES
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
New electromagnetic effects associated with cavity-backed apertures
[DE86-008768] N87-12750
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A168962] N87-13318
ELECTROMAGNETIC PULSES
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
ELECTROMAGNETIC RADIATION
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13264
ELECTROMAGNETIC SCATTERING
Computer programs for electromagnetic scattering from a slotted TM cylindrical conductor by the pseudo-image method
[AD-A169016] N87-12725
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120
ELECTROMAGNETIC SHIELDING
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
ELECTROMAGNETIC SPECTRA
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A169971] N87-13026
ELECTROMAGNETIC WAVE TRANSMISSION
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
ELECTROMAGNETISM
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329
ELECTROMAGNETS
Experimental verification of soliton theory using a microwave crossed-field amplifier
[AD-A170011] N87-12778
Temperature compensation in the 2:17 type magnets
[AD-A169487] N87-13250
ELECTRON ACCELERATORS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
Two-dimensional dynamics of the plasma Wakefield accelerator
[DE86-012362] N87-13312
ELECTRON BEAMS
Efficient, monochromatic, high-power microwave generator
[DE86-012385] N87-12792
Feasibility of investigating Smith-Purcell free-electron laser configurations by electron energy loss studies
[AD-A169059] N87-12847
High repetition rate electron beam RF-Acceleration and sub-millimeter wave generation via a free electron laser
[AD-A169846] N87-12853
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012384] N87-12864
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
ELECTRON DENSITY (CONCENTRATION)
Density and electrostatic potential distribution around a cylindrical satellite
[INPE-3953-NTE/258] N87-12595
Calculated versus experimental charge density distribution of Be metal
[AD-A169924] N87-13254
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13323
ELECTRON DENSITY PROFILES
A semi-empirical low-latitude ionospheric model
[AD-A168899] N87-13025
ELECTRON DIFFRACTION
Electron diffraction analysis of the pentagonal arrangement of grains found in CVD pure Ni films
[DE86-009023] N87-13336
ELECTRON DISTRIBUTION
Calculated versus experimental charge density distribution of Be metal
[AD-A169924] N87-13254
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13323
ELECTRON ENERGY
Feasibility of investigating Smith-Purcell free-electron laser configurations by electron energy loss studies
[AD-A169059] N87-12847
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
ELECTRON FLUX DENSITY
The secondary production of gamma rays in the Jovian magnetosphere N87-13391
ELECTRON MICROSCOPY
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-008537] N87-12667
Site occupations in Li sub 2 ordered alloys by axial electron channeling microanalysis
[DE86-009421] N87-12669
Localized ion milling of metallic and ceramic TEM specimens
[DE86-009538] N87-12900
ELECTRON OPTICS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
ELECTRON OSCILLATIONS
High gain free electron laser oscillators
[AD-A169002] N87-12846
ELECTRON PARAMAGNETIC RESONANCE
Structural features at the Si-SiO2 interface
[DE86-012947] N87-13339
ELECTRON PROBES
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12640
ELECTRON SPECTROSCOPY
Electron spectroscopy in fundamental catalytic studies
[DE86-008781] N87-12639
ELECTRON STATES
X-ray data booklet, revision
[DE86-012650] N87-13272
ELECTRON TRANSFER
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170831] N87-12782
Heterogeneous catalysis with lasers
[AD-A169601] N87-12851
Study in molecular lasers
[AD-A169933] N87-12855
ELECTRON TUBES
Unique mechanization to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
ELECTRON TUNNELING
Theory of Fractional Quantum Hall Effect
[DE86-702652] N87-13343
Tunneling effect in superconductors with magnetic impurities
[DE86-702723] N87-13345
ELECTRON-ION RECOMBINATION
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310
ELECTRONIC EQUIPMENT
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3958-PRE/876] N87-12720
Multi use gripper for industrial robot
[AD-D012371] N87-12876
ELECTRONIC EQUIPMENT TESTS
Totally self-checking circuits and testable CMOS circuits
[AD-A169756] N87-12773
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175
ELECTRONIC PACKAGING
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765
ELECTRONIC RECORDING SYSTEMS
Electronic forms. How close to value-added processing
[DE86-010484] N87-13354
ELECTRONS
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693
Electron-electron interaction effects in quasi-one-dimensional conducting polymers and related systems
[DE86-012434] N87-12697
X-ray data booklet, revision
[DE86-012650] N87-13272
ELECTROPHYSIOLOGY
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144
ELECTROSTATIC CHARGE
Density and electrostatic potential distribution around a cylindrical satellite
[INPE-3953-NTE/258] N87-12595
ELECTROSTATIC PROBES
Flight model discharge system
[AD-A169423] N87-12571
ELECTROSTRICTION
SAW transduction in electrostrictive substrates
[DE86-011651] N87-12794

ELEVATION ANGLE
Two-dimensional beamforming using a frequency domain complex Least Mean-Squares (LMS) adaptive filter
[AD-A171396] N87-12785
ELLIPSES
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
ELLIPTIC DIFFERENTIAL EQUATIONS
Regularity of the solution of elliptic problems with piecewise analytic data. Part 1: Boundary value problems for linear elliptic equation of second order
[AD-A169771] N87-13212
Long time estimates for the heat kernel associated with a uniformly subelliptic symmetric second order operator
[AD-A169949] N87-13220
EMBRITTLEMENT
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-006494] N87-12662
EMERGENCIES
The Flight Service Station Training Program: 1961-1965
[AD-A171485] N87-13145
EMISSION SPECTRA
Characterization of the atomic emission in Inconel 718 alloy metal vapor arcs
[DE86-012178] N87-12672
Measurement of atmospheric emission spectra at high altitudes
[AD-A170143] N87-13035
Airborne atmospheric electricity experiments
N87-13063
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13309
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
EMISSIVITY
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326
EMULSIONS
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627
END EFFECTORS
On the dexterity of robotic manipulators N87-12867
ENERGY ABSORPTION
Buffered explosions in steel pressure vessels
[DE86-008763] N87-12898
ENERGY BUDGETS
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Available potential energy in upper layer of world ocean N87-12949
Energy receipt partitioning over the Amazon forest
[INPE-3980-PRE/980] N87-12962
Study of satellite systems to monitor Earth's radiation budget
[CAP-420-071] N87-12994
ENERGY CONVERSION
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627
Liquid metal thermoacoustic engine
[DE86-011264] N87-12902
Proceedings of the Solar Thermal Technology Conference
[DE86-011703] N87-13002
ENERGY CONVERSION EFFICIENCY
Status and future of government-supported amorphous silicon research in the US
[DE86-010702] N87-12997
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
Middle atmosphere modeling
[NASA-CR-179934] N87-13023
ENERGY DISSIPATION
Feasibility of investigating Smith-Purcell free-electron laser configurations by electron energy loss studies
[AD-A169059] N87-12847
Equilibrium configuration of coronal loops
[DE86-702711] N87-13384
ENERGY DISTRIBUTION
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon forest
[INPE-3949-PRE/970] N87-13008
ENERGY LEVELS
Surface and adsorption-like states within the nearly free electron approximation
[DE86-702651] N87-13342
Theory of Fractional Quantum Hall Effect
[DE86-702652] N87-13343
ENERGY POLICY
Data tagging in the Energy Data Base
[DE86-010621] N87-13355
ENERGY STORAGE
Development of regenerable energy storage for space multimegawatt applications
[DE86-011070] N87-12998
ENERGY TRANSFER
Heterogeneous catalysis with lasers
[AD-A169601] N87-12951
Iodine monofluoride energy transfer studies
[AD-A169781] N87-12952
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] N87-13005
Donor-acceptor one step energy transfer via exchange coupling on a fractal lattice
[AD-A169843] N87-13325
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13387
ENGINE PARTS
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A168979] N87-12628
ENGINE STARTERS
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
ENGINES
Liquid metal thermoacoustic engine
[DE86-011264] N87-12902
ENRICHMENT
Status of laser enrichment technology update
N87-12717
ENUMERATION
An implicit enumeration procedure for the general linear complementarity problem
[AD-A170397] N87-13189
ENVIRONMENT EFFECTS
Evaluation of remote sensing techniques to the detection of changes in a fluvial system due to human influence: The example of Canas River Basin (Sao Paulo State, Brazil)
[INPE-3970-PRE/983] N87-12960
Direct effects of atmospheric CO2 enrichment on plants and ecosystems: A bibliography with abstracts
[DE86-013525] N87-13012
ENVIRONMENT MODELS
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733
Conversion of the NOLAPS (Navy Operational Local Atmospheric Prediction System) model to the HP9845
[AD-A169538] N87-13108
ENVIRONMENTAL CONTROL
The ecology of microorganisms in a small closed system: Potential benefits and problems for space station
[NASA-TM-86563] N87-13166
ENVIRONMENTAL MONITORING
Effects of graphitization on the environmental stability of brominated pitch-based fibers
[NASA-TM-88899] N87-12679
ENVIRONMENTAL SURVEYS
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
ENVIRONMENTAL TESTS
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Evaluation of the multifunction sensor acceleration sensitive terms MU sub A and MU sub B
[AD-A169811] N87-12835
EPITAXY
Rapid synthesis of indium phosphide
[AD-D012362] N87-13322
Epitaxial crystallization and epitaxial polymerization as tools for molecular engineering
[AD-A171506] N87-13333
EPOXY RESINS
Stress effects on moisture transport in an epoxy resin and its composite
[AD-A169306] N87-12617
Investigation of the effects of cobalt ions on epo properties
[NASA-TP-2639] N87-126
EQUATIONS OF MOTION
Introduction to aerodynamics derivitives, equations motion and stability
[ESDU-89021] N87-1283
Simplified forms of performance equations. Addendu A: Effect on aeroplane level speed of small changes thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-1253
A mathematical formulation of a large space structu control problem
[AD-A169950] N87-1200
Dynamic analysis of anisotropic conical shells
[EPM/RT-86-36] N87-1291
Analysis of anisotropic thin conical shells
[EPM/RT-86-33] N87-1291
Dynamic analysis of a Timoshenko beam using a fini element approach
[EPM/RT-86-34] N87-1291
Free vibration of axisymmetric and beam-like cylindric shells, partially filled with liquid
[EPM/RT-86-35] N87-1293
EQUATIONS OF STATE
Phase equilibrium predictions for polar and hydroge bonding mixtures
[DE86-011812] N87-1264
Models and radiation of railgun plasma armatures wi non-ideal plasma properties
[AD-A169349] N87-1325
EQUILIBRIUM EQUATIONS
Dynamic analysis of anisotropic conical shells
[EPM/RT-86-36] N87-1291
EQUIPARTITION THEOREM
A partition of sensible and latent heat fluxes above t terra firma area in the Amazon forest
[INPE-3949-PRE/970] N87-1300
EQUIPMENT SPECIFICATIONS
Circuit considerations for repetitive railguns
[DE86-012369] N87-1275
Development of an inexpensive, high resolution positro multiwire proportional counter
[DE86-011576] N87-1284
Double-ended tuning fork quartz accelerometer
[DE86-012277] N87-1284
EQUIVALENT CIRCUITS
The analysis of a transistor cap as a heat dissipat
[AD-A171396] N87-1276
ERGODIC PROCESS
Heredity of stationary and reversible stochast processes
[AD-A169926] N87-1323
EROSION
Advanced electric propulsion MP (magnetoplasmadynamic)
[AD-A169792] N87-1281
ERROR ANALYSIS
Comparative thermal conductivity measurements Sandia National Laboratories
[DE86-012926] N87-1264
A procedure for automatic treatment of dynamic system state observation bias errors
[INPE-3908-PRE/918] N87-1317
The optimal linear combination of control variates in t presence of bias
[AD-A169111] N87-1321
Asymptotically exact a-posteriori error estimator f biquadratic elements
[AD-A169798] N87-1321
The h-p version of the finite element method wi quasiuniform meshes
[AD-A170144] N87-1322
ERROR DETECTION CODES
Totally self-checking circuits and testable CMO circuits
[AD-A169756] N87-1277
ERRORS
Unique mechanization to fault isolate failures of electron tube Radio Frequency (RF) amplifier and its hi voltage power supply
[AD-D012376] N87-1277
Evaluation of the multifunction sensor acceleratio sensitive terms MU sub A and MU sub B
[AD-A169811] N87-1283
Airborne spectroradiometry: The application of AIS da to detecting subtle mineral absorption features
N87-1297
Availability and consistency of global information computer networks
[AD-A169247] N87-1328
Quality assessment and control of finite eleme solutions
[NASA-TM-89208] N87-1322

ESOPHAGUS
Quantification of respiratory muscle performance
[AD-A169208] N87-13128
ESTIMATES
The measurement of the psychological workload during task-related activities, including car driving, by competing time interval estimation N87-13153
Asymptotically exact a-posteriori error estimator for biquadratic elements
[AD-A169798] N87-13213
Algorithm for positive definite least square estimation of parameters
[DE86-012159] N87-13225
ESTIMATING
An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow (axial force)
[BR-100271] N87-12540
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230
ETCHING
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A169877] N87-12758
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170772] N87-12781
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12787
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A169963] N87-13316
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331
ETHYLENE OXIDE
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169038] N87-12683
EULER EQUATIONS OF MOTION
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544
EUROPE
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
Minutes of MAP/WINE experimenters meeting, Prague, Czechoslovakia, August 13, 1985 N87-13018
Station climatic summaries, Europe
[AD-A167868] N87-13100
EVALUATION
Evaluating ecosystem response to toxicant stress: a state space approach
[DE86-011777] N87-13009
Evaluation of man machine systems: Introduction and overview N87-13147
Ergonomic requirements for the design of control rooms. Evaluation method N87-13158
Basic conceptions for the evaluation of man machine systems N87-13161
A measure of usability — man machine systems N87-13163
Evaluation of the bearing and knowledge requirements of man machine systems N87-13164
EVAPOTRANSPIRATION
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/965] N87-12964
EVOKED RESPONSE (PSYCHOPHYSIOLOGY)
Application of heart rate measurements to maritime research simulator
[AD-A169988] N87-13132
EXAMINATION
An examination of technology transfer as a tool for management
[AD-A169184] N87-13360
EXCHANGING
Donor-acceptor one step energy transfer via exchange coupling on a fractal lattice
[AD-A169843] N87-13325
EXCITATION
Reactor-pumped laser experiments in the Sandia SPR-3 Facility
[DE86-012163] N87-12861
Band description of materials with localizing orbitals
[DE86-010529] N87-13255
Picosecond nonlinear resonant interactions in semiconductors
[AD-A169992] N87-13327
EXCITONS
Picosecond nonlinear resonant interactions in semiconductors
[AD-A170813] N87-13330
EXHAUST NOZZLES
Thrust reverser-exhaust nozzle assembly for a gas turbine engine
[AD-D012390] N87-12561
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
EXOBIOLOGY
Aerospace Medicine and Biology: A continuing bibliography with indexes
[NASA-SP-7011(290)] N87-13125
EXPANSION
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
EXPERT SYSTEMS
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567
A prototype maintenance expert system for the CH-47 flight control hydraulic system
[AD-A169019] N87-12568
Knowledge-based pitch detection
[AD-A169069] N87-12730
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169855] N87-13214
Application of a network associative scene analysis model
[INPE-3945-PRE/967] N87-13244
EXPLOSIONS
Buffered explosions in steel pressure vessels
[DE86-008763] N87-12898
EXPLOSIVES
Axial detonator for simultaneous ignition of multiple HE points
[DE86-011878] N87-12543
Preparation of energetic compounds
[AD-A170022] N87-12704
Modeling of high-explosive driven plasma compression opening switches
[DE86-012421] N87-12795
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821
EXPONENTIAL FUNCTIONS
Note on a characterization of exponential distributions
[AD-A169896] N87-13215
EXTERNAL SURFACE CURRENTS
Density and electrostatic potential distribution around a cylindrical satellite
[INPE-3953-NTE/258] N87-12595
EXTRAPOLATION
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
EXTRAVEHICULAR ACTIVITY
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167
EXTREMUM VALUES
Extremal processes, record times and strong approximation
[AD-A169972] N87-13237
EYE MOVEMENTS
High-resolution analysis of eye movements
[AD-A170779] N87-13136
Eye movements as an index of mental workload
[AD-A169941] N87-13143
The eye-mark investigation as an anthropotechnical method to study man machine systems N87-13160

F

F REGION
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
F-4 AIRCRAFT
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169675] N87-13352
F-106 AIRCRAFT
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
FABRICATION
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12785
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12787
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13266
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A169963] N87-13316
FABRICS
Improved anti-G suit
[AD-D012378] N87-13171
FACTOR ANALYSIS
AIS spectra of desert shrub canopies N87-12987
FACTORIZATION
Matrix factorization on a hypercube multiprocessor
[DE86-011775] N87-13193
Maintaining LU factors of a general sparse matrix
[AD-A169255] N87-13248
FAILURE
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
FAILURE ANALYSIS
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12672
Reliability prediction models for mechanical equipment
[AD-A169775] N87-12911
A finite element method for localized failure analysis
[AD-A169117] N87-12930
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
FAIRINGS
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543
FAR INFRARED RADIATION
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13309
Search for far infrared radiation from optically and acoustically pumped defect modes
[AD-A169159] N87-13319
FARADAY EFFECT
Optical fiber sensors for the measurement of pulsed electric currents N87-13281
FARM CROPS
Report on the activities of the irrigated crop survey in Sao Paulo State from remote sensing products, phase 2
[INPE-3950-RPE/513] N87-12969
FAST NUCLEAR REACTORS
Reactor-pumped laser experiments in the Sandia SPR-3 Facility
[DE86-012163] N87-12861
FASTENERS
Light socket removal tool
[AD-D012368] N87-12710
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12672
Super gripper variable vane arm
[AD-D012364] N87-12674
FATIGUE (BIOLOGY)
Crew factors in flight operations. Part 3: The operational significance of exposure to short-haul air transport operations
[NASA-TM-88322] N87-13122
FATIGUE (MATERIALS)
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
FATIGUE LIFE
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
Fundamental research on tribology
[AD-A169974] N87-12882

FATIGUE TESTS
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
FAULT TOLERANCE
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3958-PRE/876] N87-12720
Yield and performance enhancement through redundancy in VLSI and WSI multi-precessor systems
[AD-A169930] N87-13174
FEASIBILITY ANALYSIS
New materials for spacecraft stability and damping: A feasibility study
[AD-A169626] N87-12601
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
FEDERAL BUDGETS
National Commission on Space report
[GPO-63-143] N87-12574
Department of Housing and Urban Development-independent agencies appropriations for 1987, part 7
[GPO-61-970] N87-13357
FEEDBACK
Unique mechanization to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
FEEDBACK CONTROL
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] N87-13005
Feedback system design with an uncertain plant
[NASA-CR-176887] N87-13243
Closed loop fiber optic gyro N87-13277
Wide bandwidth, long distance fibre-optic communication systems N87-13300
FERRITES
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-008537] N87-12667
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A169362] N87-13318
FERROELECTRICITY
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-13328
FIBER COMPOSITES
A heater made from graphite composite material for potential deicing application
[NASA-TM-88888] N87-12559
FIBER OPTICS
Carrier-sense stack algorithms for multiple access communication channels
[AD-A169774] N87-12738
High resolution optical fiber print head
[AD-D012384] N87-12833
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
SPRINT 3: Serial-Parallel Remote Interface System development report
[DE86-010590] N87-13176
Feasibility of making coherent fiber-optic arrays from fused silica
[AD-A170873] N87-13271
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
Progress in optical fiber sensors N87-13274
Fibre optic gyroscopes in inertial navigation N87-13275
Comparison of ring laser and fiber-optic gyro technology N87-13276
Closed loop fiber optic gyro N87-13277
Progress with multiplexed sensor arrays based on reflection at spliced joints between sensors N87-13278
Magnetic and pressure sensors using the compensated polarimetric sensor configuration N87-13279
Fiber optic device for temperature remote sensing N87-13280
Optical fiber sensors for the measurement of pulsed electric currents N87-13281
Nonlinear ellipse rotation in a low-birefringence optical fiber N87-13282
Progress in optical fiber gyroscopes using integrated optics N87-13283
Wavelength division multiplexing at 1.5 microns for high capacity optical transmission N87-13284
A spherical waveguide multiplexer-demultiplexer N87-13285
A study of methods of phase noise reduction of semiconductor lasers for sensor applications N87-13286
Effects of optical feedback on the performance of high data rate single-mode fiber systems N87-13288
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289
Nonlinear planar guided wave interactions and devices N87-13290
Optoelectronic broadband switching for communications and signal processing N87-13294
Preparation and properties of infrared transmitting heavy metal fluoride glass optical fibers N87-13296
Glass fibres for transmission in the 8-12 micrometers waveband N87-13297
Fluoride glasses for infrared waveguides N87-13299
Wide bandwidth, long distance fibre-optic communication systems N87-13300
Performance of RF fiber optic links N87-13301
Fiber optics: A survivable and cost-effective transmission medium for terrestrial networks N87-13302
Single-mode-fibers for fiberoptic-guided missiles: A comparison with graded-index multimode fibers N87-13303
Lightwave technology in future radar equipment designs N87-13304
Tactical fiber optic assembly requirements N87-13305
A hybrid transmission scheme on single mode fibers for tactical communications N87-13306
FIBER REINFORCED COMPOSITES
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
FIELD EFFECT TRANSISTORS
Development of low-temperature transistor modules to improve the MSFC mid-infrared array
[NASA-TM-86566] N87-12756
High frequency, high voltage MOSFET isolation amplifier
[AD-D012403] N87-12774
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779
PIN-FET preamplifier for high-speed optical transmission systems N87-13293
FET charge sensor and voltage probe
[NASA-CASE-NPO-16045-1] N87-13313
FIELD THEORY (PHYSICS)
Metrics of closed world of Friedmann, agitated by electric charge (towards a theory electromagnetic Friedmann's)
[AD-A169981] N87-12723
FIGHTER AIRCRAFT
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
FILM COOLING
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
FINITE DIFFERENCE THEORY
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12807
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
FINITE ELEMENT METHOD
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169386] N87-12765
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
A new and efficient formulation for finite element analysis of thin shell structures undergoing small and large deflection N87-12913
Dynamic analysis of anisotropic conical shells
[EPM/RT-86-36] N87-12916
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
Dynamic analysis of a Timoshenko beam using a finite element approach
[EPM/RT-86-34] N87-12919
Free vibration of axisymmetric and beam-like cylindrical shells, partially filled with liquid
[EPM/RT-86-35] N87-12920
A constitutive law for finite element contact problems with unclassical friction
[NASA-TM-88838] N87-12924
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
A finite element method for localized failure analysis
[AD-A169117] N87-12930
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933
Computation of the amplitude of stress singular terms for cracks and reentrant corners
[AD-A169796] N87-12936
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170493] N87-12937
Some investigations into variable meshes for numerical solution of partial differential equations
[AD-A169977] N87-13208
Regularity of the solution of elliptic problems with piecewise analytic data. Part 1: Boundary value problems for linear elliptic equation of second order
[AD-A169771] N87-13212
Asymptotically exact a-posteriori error estimator for biquadratic elements
[AD-A169798] N87-13213
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169855] N87-13214
The h-p version of the finite element method with quasiuniform meshes
[AD-A170144] N87-13222
Quality assessment and control of finite element solutions
[NASA-TM-89208] N87-13227
FINNED BODIES
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89050] N87-12536
FIXED WINGS
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
FLANGES
Over-center toggle latch
[AD-D012393] N87-12876
FLAT PLATES
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12807
FLIGHT CHARACTERISTICS
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
FLIGHT CONTROL
Introduction to aerodynamics derivitives, equations of motion and stability
[ESDU-86021] N87-12536
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567
A prototype maintenance expert system for the CH-47 flight control hydraulic system
[AD-A169019] N87-12568
Flight model discharge system
[AD-A169423] N87-12571
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169884] N87-12711
FLIGHT CREWS
Crew factors in flight operations. Part 3: The operational significance of exposure to short-haul air transport operations
[NASA-TM-88322] N87-13122

Crew communication as a factor in aviation accidents
[NASA-TM-88254] N87-13141
Determination of the load and stress of a cockpit crew during aircraft piloting using task networks and the simulation language SAINT N87-13150
Improved anti-G suit
[AD-D012378] N87-13171

FLIGHT OPTIMIZATION
Optimal descending, hypersonic turn to heading
[DE86-010989] N87-12577

FLIGHT SIMULATION
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86785] N87-12558
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729

FLIGHT SIMULATORS
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573

FLIGHT STABILITY TESTS
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86785] N87-12558

FLIGHT TESTS
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta e squared))
[NASA-TM-87731] N87-12566

FLIGHT TRAINING
The Flight Service Station Training Program: 1981-1985
[AD-A171485] N87-13145

FLOW CHARACTERISTICS
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808

FLOW DISTRIBUTION
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87875] N87-12806
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816

FLOW EQUATIONS
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
Study of numerical solution methods for two-phase flows
[DE86-012266] N87-12821
Quantitative assessment of the effect of partial pivoting in sparse ordinary differential equation solvers
[DE86-012592] N87-13226

FLOW MEASUREMENT
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831

FLOW THEORY
The calculation of separated flows of low-viscosity liquids using the Batchelor Model
[BR-100272] N87-12810

FLOW VELOCITY
Thrust reverser-exhaust nozzle assembly for a gas turbine engine
[AD-D012390] N87-12861
Characteristics of atmospheric turbulence near the ground. Part 3: Variations in space and time for strong winds (neutral atmosphere)
[ESDU-86010-PT-3] N87-13042

FLOW VISUALIZATION
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560

FLUID DYNAMICS
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12665

FLUID FILLED SHELLS
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045

FLUID FLOW
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045
Theoretical and experimental design studies for the Atmospheric General Circulation Experiment N87-13046
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-88891] N87-13359

FLUID MECHANICS
Nonlinear waves
[AD-A169934] N87-13207

FLUID PRESSURE
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805

FLUID-SOLID INTERACTIONS
Fluids in contact with a hard surface: University of the bridge functions for the density profile
[AD-A169845] N87-13308

FLUORESCENCE
X-ray data booklet, revision
[DE86-012650] N87-13272

FLUX DENSITY
Microstructural study of high energy density dissimilar metal welds
[DE86-009284] N87-12668

FLYWHEELS
Brief analysis of normal attitude accuracies of satellites with wheels or gas jets
[INPE-3993-NTE/262] N87-12594

FOG
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102

FOG DISPERSAL
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585

FOOTPRINTS
Vector analysis and satellite footprints
[AD-A169832] N87-12576

FORCED VIBRATION
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546

FORECASTING
National Commission on Space report
[GPO-63-143] N87-12574

FOREST MANAGEMENT
Comparison of tropical forest surveys
[DE86-011699] N87-12993

FORESTS
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/965] N87-12964
Destriping AIS data using Fourier filtering techniques N87-12974
Analysis of AIS data of the Bonanza Creek Experimental Forest, Alaska N87-12962
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12963
Characterization of information requirements for studies of CO2 effects: Water resources, agriculture, fisheries, forests and human health
[DE86-012477] N87-13010

FORGING
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934

FORMAT
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729

FORMING TECHNIQUES
Mechanics of metal forming
[DE86-012414] N87-12673

FORMULAS (MATHEMATICS)
Matrix theory
[AD-A169139] N87-13247

FORTRAN
Maintaining LU factors of a general sparse matrix
[AD-A169256] N87-13249

FOURIER ANALYSIS
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-6, 1984 N87-13016

FOURIER SERIES
Computer programs for electromagnetic scattering from a slotted TM cylindrical conductor by the pseudo-image method
[AD-A169016] N87-12725
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918

FOURIER TRANSFORMATION
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169061] N87-12631
Destriping AIS data using Fourier filtering techniques N87-12974

FOVEA
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135

FRACTURE MECHANICS
Fracture toughness of CIP-HIP beryllium at elevated temperatures
[AD-A169769] N87-12654
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12658
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12678
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915
Computation of the amplitude of stress singular terms for cracks and reentrant corners
[AD-A169796] N87-12936
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940
Using combined experiment/analysis to generate dynamic critical stress intensity data
[DE86-013578] N87-12945

FRACTURE STRENGTH
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169839] N87-12620
Fracture toughness of CIP-HIP beryllium at elevated temperatures
[AD-A169769] N87-12654
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002966] N87-13334

FRACTURES (MATERIALS)
A study of the mechanism of dynamic ductile fracture of two-phase materials
[AD-A168966] N87-12925

FRACTURING
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133

FRAGMENTATION
Fragmentation dynamics of energetic materials
[AD-A168925] N87-12662

FREE CONVECTION
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12317

FREE ELECTRON LASERS
Application of nonlinear optics to free electron laser systems
[AD-A168950] N87-12845
High gain free electron laser oscillators
[AD-A169002] N87-12846
Feasibility of investigating Smith-Purcell free-electron laser configurations by electron energy loss studies
[AD-A169059] N87-12847

FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
High repetition rate electron beam RF-Acceleration and sub-millimeter wave generation via a free electron laser
[AD-A169848] N87-12853
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865

FREE VIBRATION
Free vibration of axisymmetric and beam-like cylindrical shells, partially filled with liquid
[EPM/RT-86-35] N87-12920

FREEZING
Incremental quench research
[AD-A168980] N87-13317

FREQUENCY ANALYZERS
Acoustooptic spectrum analyzer using a planar Bragg-cell N87-13295

FREQUENCY DIVIDERS
Temperature and frequency compensated array beam steering unit
[AD-D012365] N87-12767

FREQUENCY MODULATION
Performance of RF fiber optic links N87-13301

FREQUENCY SHIFT
Doppler effect laser velocity measuring system
[AD-D012401] N87-12854
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289

FRESNEL LENSES
Photovoltaic Concentrator Technology Project, Fourteenth Project Integration Meeting, June 10-11, 1986
[DE86-012051] N87-13006

FRICTION
Fundamental research on tribology
[AD-A169974] N87-12882
A constitutive law for finite element contact problems with unclassical friction
[NASA-TM-88838] N87-12924

FUEL CELLS
Development of regenerable energy storage for space multimegawatt applications
[DE86-011070] N87-12998

FUEL COMBUSTION
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A168976] N87-12627

FUEL SYSTEMS
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A168979] N87-12628

FUNCTIONAL ANALYSIS
Statistical analysis and use of VAS radiance data N87-13086

FUNCTIONAL DESIGN SPECIFICATIONS
A method for the optimum design of the man machine interface N87-13159
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200

FUSES (ORDNANCE)
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A168877] N87-12758

FUSION REACTORS
Application of hydrogen embrittlement models to the crack growth behavior of fusion reactor materials
[DE86-011614] N87-12671
Tara vacuum system
[DE86-011873] N87-13311

G

GALACTIC NUCLEI
On the two states of CYG X-1 and related sources
[NASA-TM-89285] N87-13367
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179926] N87-13368

GALAXIES
The space station millimeter facility
[AD-A168983] N87-12804

GALLIUM ARSENIDES
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A168877] N87-12758
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326

GAMMA RAY BURSTS
Stratospheric balloon experiments
[INPE-3995-RPE/519] N87-13020

GAMMA RAY LASERS
Moessbauer-Bormann superradiance
[DE86-012373] N87-12866

GAMMA RAY SPECTROMETERS
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394

GAMMA RAYS
Contributions to the 16th International Cosmic Ray Conference
[ATR-86(9558)-11] N87-13389
The secondary production of gamma rays in the Jovian magnetosphere N87-13391
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394
Characterization of the gamma radiation in space and in the atmosphere
[DE86-013445] N87-13397

GAS DYNAMICS
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258

GAS EXCHANGE
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12644

GAS FLOW
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12807

GAS IONIZATION
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310

GAS JETS
Brief analysis of normal attitude accuracies of satellites with wheels or gas jets
[INPE-3993-NTE/262] N87-12594

GAS LASERS
Optical rotation sensors
[AD-A169357] N87-12846
Reactor-pumped laser experiments in the Sandia SPR-3 Facility
[DE86-012163] N87-12861

GAS TUNGSTEN ARC WELDING
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12890
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12891
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012538] N87-12892
Gas tungsten arc welding of aluminum alloys 6XXX. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012548] N87-12893
Gas tungsten arc welding of carbon steel to nickel-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012549] N87-12894
Gas tungsten arc welding of chromium-nickel steel to nickel-molybdenum-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012550] N87-12895
Welding procedure specification: Gas tungsten arc welding of nickel to nickel-chromium-iron. Supplement 1: Records of procedure qualification tests
[DE86-012557] N87-12896
Gas tungsten arc welding of aluminum alloys 3004, 5052 and 5x54 to 6xxx. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012561] N87-12897

GAS TURBINE ENGINES
Thrust reverser-exhaust nozzle assembly for a gas turbine engine
[AD-D012390] N87-12561

GAS TURBINES
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12583
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706
Self-locking outer air seal with full backside cooling
[AD-D012406] N87-12880

GAS WELDING
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12886
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12887
Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12888
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889

GAS-SOLID INTERACTIONS
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12644

GASES
Double-resonance techniques for high-resolution Raman-spectroscopy
[DE86-009640] N87-12545
Modeling of high-explosive driven plasma compression opening switches
[DE86-012421] N87-12795
Detonation cellular structure and image process
[DE86-006467] N87-12819

GATES (CIRCUITS)
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
Declarative descriptions for VLSI generators
[AD-A169952] N87-12777
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12787
FET charge sensor and voltage probe
[NASA-CASE-NPO-16045-1] N87-13313

GAUGE THEORY
Theoretical high energy physics
[DE86-012669] N87-13259

GEOBOTANY
Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop
[NASA-CR-179924] N87-12968
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984

GEODYNAMICS
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178

GEOLOGICAL SURVEYS
Geologic remote sensing at INPE: An overview
[INPE-3975-PRE/987] N87-12959
Relief and geology of the north polar region of the planet Venus
[NASA-TM-88498] N87-13376

GEOLOGY
Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop
[NASA-CR-179924] N87-12968

GEOMAGNETISM
Solar flux and geomagnetic activity prediction
[INPE-3984-PRE/934] N87-13377

GEOMETRIC RECTIFICATION (IMAGERY)
Modulation Transfer Function (MTF) of the geometrical image resolution of the thermal infrared band
[INPE-3964-TDL/231] N87-12809

GEOMETRY
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555

GEOPHYSICS
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Meteorological effects of geotectonic phenomena hypothesized N87-12947
Solar control of geophysical phenomena N87-12953
Earth sciences research in the Civil Space Program
[PB86-232014] N87-12995
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045
GEOSTROPHIC WIND
Utilization of satellite cloud information to diagnose the energy state and transformations in extratropical cyclones N87-13051
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
GEOSYNCHRONOUS ORBITS
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575
GERMANIUM ALLOYS
Atomic resolution study of precipitates in an Al-Ge alloy
[DE86-011308] N87-12670
GLASS
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169036] N87-12683
Laser sealed vacuum insulating window
[DE86-013678] N87-12701
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A168877] N87-12758
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013754] N87-12802
GLASS FIBERS
Glass fibres for transmission in the 8-12 micrometers waveband N87-13297
Single crystal fibers N87-13298
Fluoride glasses for infrared waveguides N87-13299
GLIDE PATHS
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
GLOBAL POSITIONING SYSTEM
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169766] N87-12554
Multi-element adaptive antenna array
[AD-D012410] N87-12740
GOALS
National Commission on Space report
[GPO-63-143] N87-12574
GOES SATELLITES
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
Estimation of precipitation from GOES IR imagery during FGGE: Application to diagnostic studies N87-13048
Studies of lightning data in conjunction with geostationary satellite data N87-13056
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
Detection of rotating thunderstorms using satellite imagery N87-13085
GOVERNMENTS
Government libraries. A periodicals bibliography, together with list of bibliographies and indexes
[AD-A169422] N87-13351
The uncounted benefits: Federal efforts in domestic technology transfer
[NASA-CR-177044] N87-13358
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13361
GRAIN BOUNDARIES
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-009464] N87-12662
Radiation-induced segregation to grain boundaries in a Ni-Si alloy
[DE86-010027] N87-12664
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12668
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12669
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13336
GRAIN SIZE
Electron diffraction analysis of the pentagonal arrangement of grains found in CVD pure Ni films
[DE86-009023] N87-13336
GRAMMARS
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729
GRAPHITE
Densification of graphites by irradiation
[DE86-010026] N87-12696
GRAPHITE-EPOXY COMPOSITES
A heater made from graphite composite material for potential deicing application
[NASA-TM-88668] N87-12559
GRAPHITIZATION
Effects of graphitization on the environmental stability of brominated pitch-based fibers
[NASA-TM-88699] N87-12679
GRAPHS (CHARTS)
Eigenvectors of graphs
[AD-A170562] N87-13223
GRATINGS (SPECTRA)
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13266
GRAVIMETRY
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
GRAVITATION
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
Canonical quantization of gravity
[DE86-702615] N87-13372
GRAVITATIONAL WAVES
Observations on the Stanford 4800 KG gravity wave detector with a cosmic ray monitor N87-13399
GRAVITY GRADIOMETERS
Development of a sensitive superconducting gravity gradiometer for geological and navigational applications
[NASA-CR-4011] N87-13021
GRAVITY WAVES
Middle atmosphere modeling
[NASA-CR-179934] N87-13023
GREEN'S FUNCTIONS
Surface green function matching for a three-dimensional non-local continuum
[DE86-702647] N87-13341
GROUND STATIONS
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169746] N87-12599
GROUND SUPPORT EQUIPMENT
Instrumentation research and support services
[AD-A169278] N87-13029
GROUND WIND
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107
Calibration and accuracy of the NOAA/ERL gust probe system and intercomparison with other systems
[PB86-221736] N87-13116
GROUP THEORY
Upper bounds for symmetric Markov transition functions
[AD-A170010] N87-13221
A unified approach to constructing nonparametric rank tests
[AD-A169815] N87-13233
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242
GROWTH
Comparison of Rayleigh-Taylor growth with 1.0 m and 0.25 m lasers
[DE86-012217] N87-12662
GUIDANCE (MOTION)
Advanced guidance algorithms for homing missiles with bearing-only measurements
[AD-A170633] N87-12563
GULF STREAM
The Gulf Stream dynamics experiment. Inverted echo sounder data report for the June 1984 to May 1985 deployment period
[AD-A170758] N87-13121
GUST LOADS
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570
GUSTS
Calibration and accuracy of the NOAA/ERL gust probe system and intercomparison with other systems
[PB86-221736] N87-13116
GYROSCOPES
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12553
GYROSCOPIC STABILITY
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12834
Evaluation of the multifunction sensor acceleration sensitive terms MU sub A and MU sub B
[AD-A169811] N87-12835

H

HALL EFFECT
Theory of Fractional Quantum Hall Effect
[DE86-702652] N87-13343
HARDENING (MATERIALS)
An analysis of shear band development incorporating heat conduction
[AD-A168972] N87-12926
HARDNESS
Fluids in contact with a hard surface: University of the bridge functions for the density profile
[AD-A168945] N87-13306
HARMONIC ANALYSIS
Linear harmonic analysis of free-piston Stirling engines
[DE86-012451] N87-12903
HARMONICS
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252
HAWAII
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107
HAZE
Studies of humid continental haze during SPACE N87-13088
HEAD (ANATOMY)
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
HEART RATE
Application of heart rate measurements to maritime research simulator
[AD-A169986] N87-13132
Self-paced heat acclimation procedures
[AD-A170533] N87-13134
HEAT ACCLIMATIZATION
Self-paced heat acclimation procedures
[AD-A170533] N87-13134
HEAT BUDGET
Study of satellite systems to monitor Earth's radiation budget
[CAP-420-071] N87-12994
HEAT EXCHANGERS
Phase change thermal energy storage methods for combat vehicles, phase 1
[AD-A170492] N87-12713
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013836] N87-12714
HEAT FLUX
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A168948] N87-12870
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/985] N87-12964
HEAT MEASUREMENT
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12799

HEAT OF COMBUSTION
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A168948] N87-12870
HEAT PIPES
Integrated heat pipe-thermal storage design for a solar receiver
[DE86-011235] N87-12999
Compact reactor/ORC power source
[DE86-011252] N87-13260
Neutronic design studies for an unattended, low power reactor
[DE86-011228] N87-13262
HEAT PUMPS
Dual temperature thermal storage with complex compounds
[DE86-011511] N87-13000
HEAT RESISTANT ALLOYS
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
HEAT SINKS
The analysis of a transistor cap as a heat dissipator
[AD-A171398] N87-12786
HEAT STORAGE
Phase change thermal energy storage methods for combat vehicles, phase 1
[AD-A170492] N87-12713
Integrated heat pipe-thermal storage design for a solar receiver
[DE86-011235] N87-12999
Dual temperature thermal storage with complex compounds
[DE86-011511] N87-13000
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
HEAT TOLERANCE
Self-paced heat acclimation procedures
[AD-A170533] N87-13134
HEAT TRANSFER
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013639] N87-12714
The analysis of a transistor cap as a heat dissipator
[AD-A171398] N87-12786
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
Apparatus for downward transport of heat
[DE86-013700] N87-12824
Periodic heat transfer through an inhomogeneous medium
[DE86-702966] N87-12825
Analysis of laminar flow heat transfer in uniform temperature circular tubes with tape inserts
[PB86-224763] N87-12826
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A168948] N87-12870
Heat measurements in inertia welding of aluminum to steel
[DE86-012463] N87-12885
Integrated heat pipe-thermal storage design for a solar receiver
[DE86-011235] N87-12999
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-83891] N87-13359
HEAT TRANSFER COEFFICIENTS
Heat transfer characteristics of simulated microelectronic chips under normal and enhanced conditions
[PB86-224425] N87-12804
HEATERS
A heater made from graphite composite material for potential deicing application
[NASA-TM-88866] N87-12559
Incremental quench research
[AD-A168980] N87-13317
HEATING
Heat measurements in inertia welding of aluminum to steel
[DE86-012463] N87-12885
HEAVY IONS
Resonant photon pumping mechanisms for a plasma X-ray laser
[AD-D012416] N87-12857
HEAVY NUCLEI
The ultraheavy cosmic rays: Propagation and selective acceleration N87-13390
HELICOPTER CONTROL
Obstacle-warning radar for helicopters N87-13149
HELICOPTER DESIGN
Anthropometric handicaps in the construction of a helicopter cockpit — seats N87-13148
HELICOPTERS
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
The siting, installation and operational suitability of the Automated Weather Observing System (AWOS) at heliports
[DOT/FAA/PM-86/30] N87-13099
HELIOSTATS
Proceedings of the Solar Thermal Technology Conference
[DE86-011703] N87-13002
HELIPORTS
The siting, installation and operational suitability of the Automated Weather Observing System (AWOS) at heliports
[DOT/FAA/PM-86/30] N87-13099
HERBIG-HARO OBJECTS
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
HETEROJUNCTION DEVICES
Millimeter-wave heterojunction two-terminal devices
[AD-A168985] N87-12760
HETEROJUNCTIONS
Millimeter-wave heterojunction two-terminal devices
[AD-A168985] N87-12760
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337
HEURISTIC METHODS
An implicit enumeration procedure for the general linear complementarity problem
[AD-A170397] N87-13189
SOAR user's manual
[AD-A169005] N87-13204
HIGH ACCELERATION
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
HIGH ALTITUDE BALLOONS
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
HIGH ENERGY INTERACTIONS
Dual between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A168946] N87-13245
Theoretical high energy physics
[DE86-012669] N87-13259
Astro-particle-physics
[DE86-702946] N87-13373
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394
HIGH ENERGY PROPELLANTS
Preparation of energetic compounds
[AD-A170022] N87-12704
HIGH GAIN
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865
HIGH LEVEL LANGUAGES
Catalog of Resources for Education in Ada (Trade name) and Software Engineering (CREASE), version 4.0
[AD-A169692] N87-13186
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198
HIGH POWER LASERS
High power semiconductor laser sources
[AD-A168900] N87-12844
Optical pumping of high power lasers with an array of plasma pinches
[AD-A168950] N87-12856
HIGH PRESSURE
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A168976] N87-12827
Shower and high-pressure oil temperature control
[DE86-009398] N87-12899
HIGH RESOLUTION
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
HIGH SPEED PHOTOGRAPHY
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
HIGH STRENGTH STEELS
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12663
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
HIGH TEMPERATURE
Stability of multilayers at high temperatures
[DE86-010526] N87-12623
Anvil detonator: A 300EC-stable, hot-wire-ignited, nonprimary-explosive device
[DE86-013635] N87-12707
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923
Compact reactor/ORC power source
[DE86-011252] N87-13260
HIGH TEMPERATURE FLUIDS
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169136] N87-12633
HIGH TEMPERATURE PLASMAS
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12863
HIGH VOLTAGES
Unique mechanization to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
Preliminary material testing of ceramic and wood
[AD-A169657] N87-12771
HILBERT SPACE
Upper bounds for symmetric Markov transition functions
[AD-A170010] N87-13221
HIPPOCAMPUS
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144
HOLDERS
Multi use gripper for industrial robot
[AD-D012371] N87-12876
HOLOGRAPHY
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
Development of a large-aperture PLZT shutter with enhanced operational/environmental capabilities
[DE86-011643] N87-12838
HOMING
Advanced guidance algorithms for homing missiles with bearing-only measurements
[AD-A170833] N87-12563
HOMODYNE RECEPTION
Optical quadrature demodulator for coherent detection and sensor applications N87-13237
HOMOGENEITY
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
HOMOTOPY THEORY
HOMPACK: A suite of codes for globally convergent homotopy algorithms
[DE86-011644] N87-13196
HOT ISOSTATIC PRESSING
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12639
HOUSINGS
TDD antenna: Foil formed, substrate loaded laser welded assembly
[AD-D012411] N87-12712
HUBBLE SPACE TELESCOPE
Space infrared telescope facility wide field and diffraction limited array camera (IRAC)
[NASA-CR-177041] N87-13362

HUMAN BEHAVIOR
Evaluation of remote sensing techniques to the detection of changes in a fluvial system due to human influence: The example of Canas River Basin (Sao Paulo State, Brazil)
[INPE-3970-PRE/983] N87-12900
Application of heart rate measurements to maritime research simulator
[AD-A169968] N87-13132
HUMAN BEINGS
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
HUMAN BODY
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126
Physical interaction of 1-Hz to 100 kHz electric and magnetic fields with living organisms
[DE86-012323] N87-13139
Concept study - vehicle waste disposal system
[AD-A169045] N87-13168
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
HUMAN FACTORS ENGINEERING
Crew communication as a factor in aviation accidents
[NASA-TM-88254] N87-13141
Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems
[DGLR-85-04] N87-13148
Evaluation of man machine systems: introduction and overview N87-13147
System-ergonomic workload analysis for highly automated process control tasks N87-13152
Investigation of vibrations of the spinal column of healthy subjects N87-13155
Review of the methods applied in the Federal Republic of Germany to investigate human factors in nuclear power plant control N87-13156
Ergonomic requirements for the design of control rooms. Evaluation method N87-13158
A method for the optimum design of the man machine interface N87-13159
Inquiry techniques for the evaluation of man machine systems N87-13162
A measure of usability — man machine systems N87-13163
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1986
[AD-A169473] N87-13246
HUMAN PERFORMANCE
Quantification of respiratory muscle performance
[AD-A169208] N87-13128
Human performance aspects of small screen displays: A literature review revealing the lack of specific research
[AD-A170660] N87-13172
HUMAN REACTIONS
Application of heart rate measurements to maritime research simulator
[AD-A169968] N87-13132
HUMIDITY
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Studies of humid continental haze during SPACE N87-13088
HURRICANES
Third International Symposium on Tropical Meteorology N87-12948
Variation objective analyses for cyclone studies N87-13050
Utilization of satellite cloud information to diagnose the energy state and transformations in extratropical cyclones N87-13051
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052
Deep convection in mesoscale convective systems N87-13055
Storm severity detection (RF) N87-13057
Summary of 1986 Atlantic tropical cyclone activity and verification of author's seasonal forecast N87-13097
HYDRAULIC EQUIPMENT
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
Shock absorbing device with integral pressure relief valve
[AD-D012379] N87-12877
Reliability prediction models for mechanical equipment
[AD-A169775] N87-12911
HYDRAULIC SHOCK
Multiple rate shock isolator damping valve
[AD-D012394] N87-12879
HYDRIDES
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12644
HYDROCARBONS
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
HYDRODYNAMIC EQUATIONS
Nonlinear waves
[AD-A169934] N87-13207
HYDRODYNAMICS
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
Free-Lagrangian hydrodynamics using massless tracer points
[DE86-012406] N87-12822
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12823
HYDROGEN
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12644
Raman spectroscopic investigation of molecular hydrogen
[DE86-012838] N87-12646
Nuclear reaction analysis of hydrogen in metals
[AD-A169032] N87-12649
HYDROGEN BONDS
Phase equilibrium predictions for polar and hydrogen bonding mixtures
[DE86-011812] N87-12642
HYDROGEN EMBRITTLEMENT
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12658
Application of hydrogen embrittlement models to the crack growth behavior of fusion reactor materials
[DE86-011614] N87-12671
HYDROGEN FUELS
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706
HYDROGEN IONS
Polarized H(-) source development at BNL
[DE86-012704] N87-13257
HYDROLOGY
Generalization of one-dimensional solute transport: A stochastic-convective flow conceptualization
[DE86-011117] N87-12820
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/259] N87-12963
HYDROPHONES
Progress with multiplexed sensor arrays based on reflection at spliced joints between sensors N87-13278
HYDROSTATICS
Variation objective analyses for cyclone studies N87-13050
HYPERBOLIC DIFFERENTIAL EQUATIONS
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821
HYPERFINE STRUCTURE
Structural features at the Si-SiO2 interface
[DE86-012947] N87-13339
HYPERSONIC FLIGHT
Optimal descending, hypersonic turn to heading
[DE86-010969] N87-12577
HYPERSPACES
Matrix factorization on a hypercube multiprocessor
[DE86-011775] N87-13193
HYPERVELOCITY GUNS
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258
HYPERVELOCITY PROJECTILES
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603
HYPERVENTILATION
Quantification of respiratory muscle performance
[AD-A169208] N87-13128
HYPOTHERMIA
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127

I

ICE
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
First meeting of the Working Group on the Shuttle Microwave Precipitation Radiometer (SMPR) N87-13096
ICE ENVIRONMENTS
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
ICE FORMATION
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
IFF SYSTEMS (IDENTIFICATION)
Simulation of CIFF (Centralized IFF) remote control displays
[AD-A170367] N87-12742
IGNITION
Axial detonator for simultaneous ignition of multiple HE points
[DE86-011876] N87-12643
Anvil detonator: A 300EC-stable, hot-wire-ignited, nonprimary-explosive device
[DE86-013635] N87-12707
IGNITION LIMITS
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169076] N87-12627
IMAGE ANALYSIS
Knowledge-based pitch detection
[AD-A169069] N87-12730
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3982-TDL/234] N87-12990
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
Application of a network associative scene analysis model
[INPE-3945-PRE/967] N87-13244
IMAGE ENHANCEMENT
Image enhancement equipment capabilities
[DE86-013615] N87-12800
IMAGE PROCESSING
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
Very low bandwidth, unattended imager for surveillance applications
[DE86-013570] N87-12799
Detonation cellular structure and image proces
[DE86-006467] N87-12819
Integrating computer vision with a robot arm system
[AD-A171278] N87-12864
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229
IMAGE RECONSTRUCTION
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
IMAGES
A rule-based pattern matching system for the recognition of three-dimensional line drawn objects: A foundation for video tracking
[AD-A170701] N87-13190
IMAGING SPECTROMETERS
Radiometric calibration of the airborne imaging spectrometer N87-12969
Comparison of various techniques for calibration of AIS data N87-12970
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features N87-12972
Destriping AIS data using Fourier filtering techniques N87-12974
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977

Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS) N87-12978
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979
Use of digital Munsell color space to assist interretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12981
Analysis of AIS data of the Bonanza Creek Experimental Forest, Alaska N87-12982
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12983
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
Trace element-induced stress in freshwater wetland vegetation: Preliminary results N87-12985
Patterns of vegetation in the Owens Valley, California N87-12986
AIS spectra of desert shrub canopies N87-12987

IMAGING TECHNIQUES
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86565] N87-12828
Proceedings of the Second Airborne Imaging Spectrometer Data Analysis Workshop
[NASA-CR-179924] N87-12968
Comparison of various techniques for calibration of AIS data N87-12970
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features N87-12972
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution remote sensing N87-12973
Destriping AIS data using Fourier filtering techniques N87-12974
Use of digital Munsell color space to assist interretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980

IMPACT
Remote sensing to detect ecological impacts associated with acid deposition
[DE86-011649] N87-12992

IMPACT ACCELERATION
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169

IMPACT TESTS
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
Space nuclear safety program
[DE86-012767] N87-13261

IMPEDANCE MATCHING
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784

IMPEDANCE MEASUREMENT
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12789

IMPURITIES
Effects of inertia weld parameters and contamination on weld flash shape and on joint strength: An improved study
[DE86-013074] N87-12904
Tunneling effect in superconductors with magnetic impurities
[DE86-702723] N87-13345

INCOHERENT SCATTER RADAR
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031

INCONEL (TRADEMARK)
Comparative thermal conductivity measurements at Sandia National Laboratories
[DE86-012926] N87-12647
Characterization of the atomic emission in Inconel 718 alloy metal vapor arcs
[DE86-012178] N87-12672

INDEXES (DOCUMENTATION)
Government libraries. A periodicals bibliography, together with list of bibliographies and indexes
[AD-A169422] N87-13351

INDIUM PHOSPHIDES
Rapid synthesis of indium phosphide
[AD-D012362] N87-13322

INDUCTION MOTORS
Constructive and operational characteristics of a synchronous induction motor
[INPE-3976-RPE/517] N87-12755

INDUSTRIAL MANAGEMENT
Quality management: An annotated bibliography
[AD-A169816] N87-12912

INELASTIC STRESS
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923

INEQUALITIES
Inequalities for probability contents of convex sets via geometric average
[AD-A169938] N87-13219

INERTIA
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126

INERTIAL NAVIGATION
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12553
Fibre optic gyroscopes in inertial navigation N87-13275
Comparison of ring laser and fiber-optic gyro technology N87-13276

INERTIAL PLATFORMS
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12834
Evaluation of the multifunction sensor acceleration sensitive terms MU sub A and MU sub B
[AD-A169811] N87-12835

INERTIAL UPPER STAGE
Upper stage selected for planetary missions
[NASA-NEWS-RELEASE-86-161] N87-12593

INFLATABLE STRUCTURES
Improved anti-G suit
[AD-D012378] N87-13171

INFORMATION DISSEMINATION
The uncounted benefits: Federal efforts in domestic technology transfer
[NASA-CR-177044] N87-13358

INFORMATION RETRIEVAL
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104

INFORMATION SYSTEMS
Space flight operations communications phraseology and techniques
[NASA-TM-86562] N87-12721
Federal information systems management: Problems, solutions and more problems
[AD-A171368] N87-13353

INFORMATION TRANSFER
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198

INFRARED ABSORPTION
Preparation and properties of infrared transmitting heavy metal fluoride glass optical fibers N87-13296
Single crystal fibers N87-13298
Fluoride glasses for infrared waveguides N87-13299

INFRARED ASTRONOMY
Infrared reflection nebulae in Orion molecular cloud 2
[NASA-TM-88259] N87-13363

INFRARED DETECTORS
Development of low-temperature transistor modules to improve the MSFC mid-infrared array
[NASA-TM-86566] N87-12756
Modulation Transfer Function (MTF) of the geometrical image resolution of the thermal infrared band
[INPE-3964-TDL/231] N87-12809
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095

INFRARED IMAGERY
Modulation Transfer Function (MTF) of the geometrical image resolution of the thermal infrared band
[INPE-3964-TDL/231] N87-12809
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
Remote sensing of severe convective storms N87-13075

INFRARED LASERS
Search for far infrared radiation from optically and acoustically pumped defect modes
[AD-A169159] N87-13319

INFRARED PHOTOGRAPHY
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
Space infrared telescope facility wide field and diffraction limited array camera (IRAC)
[NASA-CR-177041] N87-13362

INFRARED RADIATION
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
Estimation of precipitation from GOES IR imagery during FGGE: Application to diagnostic studies N87-13048
Phase conjugate optics and picosecond optoelectronics
[AD-A169180] N87-13286
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13309

INFRARED SCANNERS
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86565] N87-12828

INFRARED SPECTRA
Measurement of atmospheric emission spectra at high altitudes
[AD-A170143] N87-13035

INFRARED SPECTROSCOPY
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169081] N87-12631

INFRARED TRACKING
Eye movements as an index of mental workload
[AD-A169941] N87-13143

INJECTION LASERS
High power semiconductor laser sources
[AD-A168900] N87-12844

INJURIES
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169

INORGANIC CHEMISTRY
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996

INSERTION
Review of robotic component insertion system for printed wiring assemblies
[DE86-013510] N87-12907

INSERTION LOSS
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A166982] N87-13318

INSERTS
Analysis of laminar flow heat transfer in uniform temperature circular tubes with tape inserts
[PB86-224763] N87-12826
Improved anti-G suit
[AD-D012378] N87-13171

INSOLATION
Studies of humid continental haze during SPACE N87-13066

INSPECTION
Image enhancement equipment capabilities
[DE86-013615] N87-12900
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12908

INSTRUMENT LANDING SYSTEMS
Aircraft accident/incident summary reports: Erie, Pennsylvania, October 14, 1984; Albuquerque, New Mexico, February 11, 1985
[PB86-910407] N87-12549
INTAKE SYSTEMS
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
INTEGRATED CIRCUITS
Phased arrays 1985 symposium: Proceedings
[AD-A169316] N87-12732
New ultra low permittivity composites for use in ceramic packaging of Ga:As integrated circuits
[AD-A168677] N87-12758
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765
Compaction with automatic jog introduction
[AD-A169879] N87-12772
Totally self-checking circuits and testable CMOS circuits
[AD-A169756] N87-12773
In-line determination of presence of liquid phase moisture in sealed IC packages
[AD-D012408] N87-12775
Image enhancement equipment capabilities
[DE86-013615] N87-12800
Progress in optical fiber gyroscopes using integrated optics N87-13283
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A168963] N87-13316
INTEGRATED OPTICS
Optical processing
[AD-A169682] N87-13269
Progress in optical fiber gyroscopes using integrated optics N87-13283
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289
Nonlinear planar guided wave interactions and devices N87-13290
Integrated optics optical limiters N87-13292
Acoustooptic spectrum analyzer using a planar Bragg-cell N87-13295
INTEGRATORS
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
INTERACTIONAL AERODYNAMICS
Propeller/body interaction for thrust and drag
[ESDU-86017] N87-12537
INTERATOMIC FORCES
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
INTERFACES
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Importance of interfacial phenomena in separation science and technology
[DE86-011063] N87-12637
INTERFACIAL TENSION
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
Fluids in contact with a hard surface: University of the bridge functions for the density profile
[AD-A169945] N87-13308
INTERFEROMETERS
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
Storm severity detection (RF) N87-13057
INTERIOR BALLISTICS
Circuit considerations for repetitive railguns
[DE86-012369] N87-12752
INTERMETALLICS
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-008494] N87-12662
Microchemical analysis of polycrystalline Ni3Al and other ordered alloys using the field-ion microscope atom probe
[DE86-013157] N87-12677
INTERMODULATION
Rusty bolt intermodulation interference reducer
[AD-D012417] N87-12691
INTERNAL COMBUSTION ENGINES
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706
INTERNAL WAVES
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120
INTERNATIONAL COOPERATION
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
INTERPLANETARY MAGNETIC FIELDS
A study of the relationship between solar activity and interplanetary field variations
[AD-A169983] N87-13380
INTERPOLATION
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
Further results on interpolation searching of databases
[DE86-012822] N87-13356
INTERPROCESSOR COMMUNICATION
Advanced teleprocessing systems
[AD-A170007] N87-12741
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
INTERSTELLAR CHEMISTRY
The carbon twelve to carbon thirteen isotope ratio of the interstellar medium in the neighborhood of the sun N87-13386
INTERSTELLAR MATTER
The carbon twelve to carbon thirteen isotope ratio of the interstellar medium in the neighborhood of the sun N87-13386
INVERSE SCATTERING
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A168969] N87-12759
INVERTED CONVERTERS (DC TO AC)
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
INVESTIGATION
Investigation of the effects of cobalt ions on epoxy properties
[NASA-TP-2639] N87-12680
INVESTMENTS
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
INVISCID FLOW
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87675] N87-12806
The calculation of separated flows of low-viscosity liquids using the Batchelor Model
[BR-100272] N87-12810
IODINE
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
IODINE COMPOUNDS
Iodine monofluoride energy transfer studies
[AD-A169781] N87-12852
ION BEAMS
Localized ion milling of metallic and ceramic TEM specimens
[DE86-009538] N87-12900
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331
Recrystallization behavior of ion beam modified Alpha-Al sub 2 O sub 3
[DE86-009353] N87-13335
ION CURRENTS
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169038] N87-12583
ION DENSITY (CONCENTRATION)
Collection of ions in the stratosphere
[AD-A169905] N87-13032
ION EMISSION
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/988] N87-12843
ION EXCHANGE MEMBRANE ELECTROLYTES
Zinc/nickel oxide battery membrane separator studies
[DE86-012824] N87-12793
ION IMPLANTATION
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170772] N87-12781
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
Recrystallization behavior of ion beam modified Alpha-Al sub 2 O sub 3
[DE86-009353] N87-13335
ION INJECTION
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
ION IRRADIATION
Advanced electric propulsion MPD (magnetoplasmadynamic)
[AD-A169792] N87-12810
ION MICROSCOPES
APFIM studies of phase transformations
[DE86-008533] N87-12663
Microchemical analysis of polycrystalline Ni3Al and other ordered alloys using the field-ion microscope atom probe
[DE86-013157] N87-12677
ION SOURCES
Polarized H(-) source development at BNL
[DE86-012704] N87-13257
IONIZATION
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12830
Double-resonance techniques for high-resolution Raman-spectroscopy
[DE86-009640] N87-12645
IONOSPHERIC CURRENTS
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
IONOSPHERIC DISTURBANCES
Effect of pulsating auroras on frequency-time characteristics of radio signals reflected from auroral ionosphere N87-12954
IONOSPHERIC ELECTRON DENSITY
A semi-empirical low-latitude ionospheric model
[AD-A168899] N87-13025
IONOSPHERIC PROPAGATION
Phase fluctuations of ionosphere radio signals N87-12955
Transverse resonances of Earth-ionosphere wave guide in auroral region N87-12956
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
IONOSPHERIC SOUNDING
Spatial radio wave attenuation during vertical sounding of ionosphere N87-12958
IONS
Investigation of the effects of cobalt ions on epoxy properties
[NASA-TP-2639] N87-12680
Space plasma research
[NASA-CR-178985] N87-13307
IRON ALLOYS
A fundamental study of P/M processed elevated temperature aluminum alloys
[AD-A170697] N87-12657
IRRADIANCE
Moessbauer-Bormann superradiance
[DE86-012373] N87-12666
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13385
IRRADIATION
Radiation-induced segregation to grain boundaries in a Ni-Si alloy
[DE86-010027] N87-12664
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
Densification of graphites by irradiation
[DE86-010026] N87-12696
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860

IRRIGATION
Report on the activities of the irrigated crop survey in Sao Paulo State from remote sensing products, phase 2
[INPE-3950-RPE/513] N87-12969
ISOLATORS
Multiple rate shock isolator damping valve
[AD-D012394] N87-12879
ISOSTATIC PRESSURE
Fracture toughness of CIP-HIP beryllium at elevated temperatures
[AD-A169769] N87-12654
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12666
ITERATIVE SOLUTION
SOR (Successive Over-Relaxation) MGR (multigrid algorithm),(u) experiments on the crystal multicomputer
[AD-A169929] N87-13187
A generalized projection method for the solution of algebraic linear systems
[INPE-3874-PRE/930] N87-13205
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216
Quantitative assessment of the effect of partial pivoting in sparse ordinary differential equation solvers
[DE86-012592] N87-13226

J

J INTEGRAL
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
JAPAN
Possible military applications of stratospheric airship discussed N87-12716
JET AIRCRAFT
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
JET EXHAUST
Advanced optical smoke meters for jet engine exhaust measurement
[NASA-CR-179459] N87-12829
JET FLOW
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
JET LAG
Pharmacological resetting of the circadian sleep-wake cycle
[AD-A170604] N87-13137
JET MIXING FLOW
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
JET STREAMS (METEOROLOGY)
Statistical analysis and use of VAS radiance data
N87-13066
JOINTS (JUNCTIONS)
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12872
JP-4 JET FUEL
Determination of the coefficient of thermal expansion of JP-4 fuels
[AD-A171495] N87-12705
JUPITER ATMOSPHERE
The secondary production of gamma rays in the Jovian magnetosphere N87-13391

K

KALMAN FILTERS
Advanced guidance algorithms for homing missiles with bearing-only measurements
[AD-A170633] N87-12583
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
A procedure for automatic treatment of dynamic systems state observation bias errors
[INPE-3908-PRE/918] N87-13177
A generalized projection method for the solution of algebraic linear systems
[INPE-3874-PRE/930] N87-13205
Optical processing
[AD-A169882] N87-13269
Solar flux and geomagnetic activity prediction
[INPE-3884-PRE/934] N87-13377
KERNEL FUNCTIONS
Lg wave excitation and propagation in presence of one-, two- and three-dimensional heterogeneities
[AD-A169004] N87-12724
Long time estimates for the heat kernel associated with a uniformly subelliptic symmetric second order operator
[AD-A169949] N87-13220
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236
Induced quantum torsion
[DE83-702616] N87-13348
KERR ELECTROOPTICAL EFFECT
Nonlinear ellipse rotation in a low-birefringence optical fiber N87-13282
KINEMATICS
Introduction to aerodynamics derivitives, equations of motion and stability
[ESDU-86021] N87-12536
KINETIC ENERGY
Circuit considerations for repetitive railguns
[DE86-012369] N87-12752
Response of the mesoscale atmosphere to diabatic heating N87-13069
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A168946] N87-13245
KINETIC FRICTION
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12668
KINETICS
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996
KITS
Adhesive repair patch
[AD-D012422] N87-12692
KNOWLEDGE
Evaluation of the bearing and knowledge requirements of man machine systems N87-13164
KRAMERS-KRONIG FORMULA
Quantitative non-destructive evaluation of composite materials based on ultrasonic wave propagation
[NASA-CR-179631] N87-12613

L

LAGRANGE MULTIPLIERS
User's guide for NPSOL (version 4.0): A Fortran package for nonlinear programming
[AD-A169115] N87-13180
LAMINAR BOUNDARY LAYER
Finite-difference solutions for compressible laminar boundary-layer flows of a dusty gas over a semi-infinite flat plate
[UTIAS-311] N87-12607
LAMINAR FLOW
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
Analysis of laminar flow heat transfer in uniform temperature circular tubes with tape inserts
[PB86-224763] N87-12826
LAMINATES
Stability of multilayers at high temperatures
[DE86-010526] N87-12623
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12886
LANDAU-GINZBURG EQUATIONS
Theory of Fractional Quantum Hall Effect
[DE86-702652] N87-13343
LANDING
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
LANDING SIMULATION
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
LANDSAT SATELLITES
Geologic remote sensing at INPE: An overview
[INPE-3975-PRE/987] N87-12959
Report on the activities of the irrigated crop survey in Sao Paulo State from remote sensing products, phase 2
[INPE-3950-RPE/513] N87-12969
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3962-TDL/234] N87-12980
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169286] N87-12981
LANGUAGES
Language acquisition and machine learning
[AD-A169561] N87-13184
LARGE SCALE INTEGRATION
Direct writing of microstructures for solid-state electronics
[AD-A170837] N87-12769
LARGE SPACE STRUCTURES
Solar array flight dynamic experiment
[NASA-TP-2598] N87-12581
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-12602
LASER APPLICATIONS
Solar array flight dynamic experiment
[NASA-TP-2598] N87-12581
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715
Status of laser enrichment technology updated
N87-12717
Coordinated research program in pulsed power physics
[AD-A169113] N87-12762
Advanced optical smoke meters for jet engine exhaust measurement
[NASA-CR-179459] N87-12829
Sitless, intensified readout, gated spectrometer: Wavelength and efficiency calibration, time response characterization
[DE86-012349] N87-12839
Heterogeneous catalysis with lasers
[AD-A169801] N87-12851
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012364] N87-12854
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
Progress in optical fiber sensors N87-13274
Wavelength division multiplexing at 1.5 microns for high capacity optical transmission N87-13284
A hybrid transmission scheme on single mode fibers for tactical communications N87-13308
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13339
LASER FUSION
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/988] N87-12843
Comparison of Rayleigh-Taylor growth with 1.0 m and 0.25 m lasers
[DE86-012217] N87-12862
LASER HEATING
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12880
LASER INDUCED FLUORESCENCE
Population inversions in laser-initiated vacuum arcs
[AD-A170811] N87-12859
LASER INTERFEROMETRY
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
A study of methods of phase noise reduction of semiconductor lasers for sensor applications
N87-13288
LASER MODE LOCKING
Optical rotation sensors
[AD-A169357] N87-12949
LASER OUTPUTS
High power semiconductor laser sources
[AD-A169900] N87-12944
Doppler effect laser velocity measuring system
[AD-D012401] N87-12854
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12863
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13258

LASER PLASMAS
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/998] N87-12843
Population inversions in laser-initiated vacuum arcs
[AD-A170811] N87-12859
LASER PUMPING
Fragmentation dynamics of energetic materials
[AD-A169825] N87-12862
Resonant photon pumping mechanisms for a plasma X-ray laser
[AD-D012416] N87-12867
Laser produced X-ray for high resolution lithography and a photoionization laser
[AD-A170792] N87-12868
Population inversions in laser-initiated vacuum arcs
[AD-A170811] N87-12869
LASER SPECTROSCOPY
Wide bandwidth, long distance fibre-optic communication systems N87-13300
LASER WEAPONS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A169946] N87-13245
LASER WELDING
Microstructural study of high energy density dissimilar metal welds
[DE86-006284] N87-13068
Laser sealed vacuum insulating window
[DE86-013876] N87-12701
TDD antenna: Foil formed, substrate loaded laser welded assembly
[AD-D012411] N87-12712
Cylindrical laser welder
[AD-D012398] N87-12860
LASER WINDOWS
Laser sealed vacuum insulating window
[DE86-013876] N87-12701
LASERS
Study in molecular lasers
[AD-A169933] N87-12855
LASING
Mossebauer-Borrmann superradiance
[DE86-012373] N87-12866
LATCHES
Over-center toggle latch
[AD-D012388] N87-12878
LATENT HEAT
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon Forest (gradient method)
[INPE-3972-PRE/985] N87-12964
LAMPS software and mesoscale prediction studies N87-13076
LATEX
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
LATTICE VIBRATIONS
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12884
Search for far infrared radiation from optically and acoustically pumped defect modes
[AD-A169159] N87-13319
LAYOUTS
Compaction with automatic jog introduction
[AD-A169679] N87-12772
LEAD (METAL)
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
LEAD ACID BATTERIES
Performance of advanced lead acid batteries for electric vehicles
[DE85-011476] N87-12801
LEAD ZIRCONATE TITANATES
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
LEARNING
Evaluation of the bearing and knowledge requirements of man machine systems N87-13164
LEARNING MACHINES
Language acquisition and machine learning
[AD-A169581] N87-13194
LEAST SQUARES METHOD
Iterative methods for large linear and nonlinear least squares problems
[AD-A169028] N87-13209
Algorithm for positive definite least square estimation of parameters
[DE86-012159] N87-13225
LENNARD-JONES POTENTIAL
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
LENS ANTENNAS
Twin aperture phased array lens antenna
[AD-D012415] N87-12745
LENS DESIGN
A spherical waveguide multiplexer-demultiplexer N87-13255
LENSES
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13266
LIBRARIES
Government libraries. A periodicals bibliography, together with list of bibliographies and indexes
[AD-A169422] N87-13351
LIFE (DURABILITY)
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
Performance of advanced lead acid batteries for electric vehicles
[DE85-011476] N87-12801
International Conference/Workshop on Small Fatigue Cracks (2nd) held in Santa Barbara, California on 5-10 January 1986
[AD-A169060] N87-12929
Compact reactor/ORC power source
[DE86-011252] N87-13260
LIFE SUPPORT SYSTEMS
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167
LIGHT (VISIBLE RADIATION)
Basic and applied research in the field of electronics and communications
[AD-A169 29] N87-12727
Lightwave technology in future radar equipment designs N87-13304
LIGHT AMPLIFIERS
High gain free electron laser oscillators
[AD-A169002] N87-12846
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
LIGHT EMITTING DIODES
Progress in optical fiber gyroscopes using integrated optics N87-13283
LIGHT MODULATION
Fiber optic device for temperature remote sensing N87-13290
Acoustooptic spectrum analyzer using a planar Bragg-cell N87-13295
LIGHT TRANSMISSION
PIN-FET preamplifier for high-speed optical transmission systems N87-13293
LIGHTNING
Deep convection in mesoscale convective systems N87-13055
Severe storm electricity N87-13056
Storm severity detection (RF) N87-13057
Studies of lightning data in conjunction with geostationary satellite data N87-13058
Lightning mapper and the future N87-13059
Space shuttle/mesoscale lightning experiment N87-13060
Optical characteristics of lightning and thunderstorm currents N87-13061
Optical characteristics of lightning N87-13062
Airborne atmospheric electricity experiments N87-13063
Remote observations of severe storms N87-13065
NOSL experiment support
[NASA-CR-178947] N87-13140
LIMITER CIRCUITS
Integrated optics optical limiters N87-13292
LIMITS (MATHEMATICS)
Upper bounds for symmetric Markov transition functions
[AD-A170010] N87-13221
LINE OF SIGHT
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
LINE SPECTRA
Airborne atmospheric electricity experiments N87-13063
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
LINEAR ACCELERATORS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
High repetition rate electron beam RF-Acceleration and sub-millimeter wave generation via a free electron laser
[AD-A169646] N87-12853
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865
LINEAR EQUATIONS
An implicit enumeration procedure for the general linear complementarity problem
[AD-A170397] N87-13189
A generalized projection method for the solution of algebraic linear systems
[INPE-3874-PRE/930] N87-13205
LINEAR FILTERS
Zero-crossings analysis
[AD-A169937] N87-13218
LINEAR PROGRAMMING
Iterative methods for large linear and nonlinear least squares problems
[AD-A169028] N87-13209
Semigroups and Poisson-approximation
[AD-A170944] N87-13224
LINEAR SYSTEMS
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784
LINEARITY
Nonlinear waves
[AD-A169934] N87-13207
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
LIQUID ATOMIZATION
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
LIQUID CRYSTALS
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702646] N87-13340
LIQUID FILLED SHELLS
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12584
Free vibration of axisymmetric and beam-like cylindrical shells, partially filled with liquid
[EPM/RT-86-35] N87-12920
LIQUID METALS
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
Finite mean-free-paths and the electrical resistivity of liquid simple metals and binary alloys
[DE86-702662] N87-12676
Liquid metal thermoacoustic engine
[DE86-011264] N87-12902
LIQUID PHASE EPITAXY
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-13326
LIQUID PHASES
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
LIQUID-SOLID INTERFACES
Cellular solidification of transparent monotectics
[NASA-CR-177039] N87-12626
LITHIUM
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12789
LITHIUM ALLOYS
Site occupations in Li sub 2 ordered alloys by axial electron channeling microanalysis
[DE86-009421] N87-12669
LOAD DISTRIBUTION (FORCES)
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
LOADS (FORCES)
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918

LOGARITHMS
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104
LOGIC CIRCUITS
Declarative descriptions for VLSI generators
[AD-A169952] N87-12777
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12787
LOW DENSITY MATERIALS
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12684
LOW NOISE
Millimeter wave components — spaceborne microwave radiometers
[FTL-118521] N87-12605
LOW PASS FILTERS
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090
LUBRICATION
Fundamental research on tribology
[AD-A169974] N87-12882
LUMINAIRES
Light socket removal tool
[AD-D012368] N87-12710
LUNAR BASES
Lunar laboratory
[NASA-TM-89209] N87-12580
LUNAR EXPLORATION
Lunar laboratory
[NASA-TM-89209] N87-12580
LUNAR SPACECRAFT
Lunar laboratory
[NASA-TM-89209] N87-12580
LUNAR SURFACE
Lunar laboratory
[NASA-TM-89209] N87-12580

M

MACH NUMBER
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89050] N87-12538
MACHINE TOOLS
Shower and high-pressure oil temperature control
[DE86-009398] N87-12899
MACHINING
Cleaning of aluminum alloy 5083
[DE86-012573] N87-12675
MAGNETIC ANOMALIES
A survey of hard-X-rays at balloon altitudes of the Earth's atmosphere
[INPE-3954-PRE/972] N87-13388
MAGNETIC CIRCUITS
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
MAGNETIC COILS
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3895-PRE/937] N87-12590
MAGNETIC COOLING
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013638] N87-12714
MAGNETIC DOMAINS
Picosecond nonlinear resonant interactions in semiconductors
[AD-A170813] N87-13330
MAGNETIC FIELDS
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
Magnetic and pressure sensors using the compensated polarimetric sensor configuration N87-13279
Two-dimensional dynamics of the plasma Wakefield accelerator
[DE86-012382] N87-13312
Flux spiral instability in a transport current carrying type 2 superconductor
[DE86-702724] N87-13346
Rapid fluctuations in solar flares
[NASA-CR-179694] N87-13387
MAGNETIC FLUX
Equilibrium configuration of coronal loops
[DE86-702711] N87-13384
MAGNETIC INDUCTION
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A169971] N87-13026
MAGNETIC MATERIALS
Picosecond nonlinear resonant interactions in semiconductors
[AD-A169992] N87-13327
MAGNETIC MIRRORS
Stabilizing effects of finite-amplitude RF waves on the interchange instability
[DE86-013042] N87-12751
MAGNETIC MOMENTS
Transition metal. 2: Complexes of dithiacycloph anes
[AD-A169107] N87-12651
MAGNETIC PERMEABILITY
Transition metal. 2: Complexes of dithiacycloph anes
[AD-A169107] N87-12651
MAGNETIC PROPERTIES
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731
MAGNETIC PUMPING
High repetition rate electron beam RF-Acceleration and sub-millimeter wave generation via a free electron laser
[AD-A169646] N87-12853
MAGNETIC RESONANCE
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731
Transverse resonances of Earth-ionosphere wave guide in auroral region N87-12956
Perceptual factors in workload: A neuromagnetic study
[AD-A169934] N87-13142
MAGNETIC STARS
Investigations of long-period DQ Herculis star N87-13364
MAGNETIC STORMS
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
MAGNETIZATION
Temperature compensation in the 2:17 type magnet s
[AD-A169487] N87-13250
MAGNETOHYDRODYNAMICS
Liquid metal thermoacoustic engine
[DE86-011264] N87-12902
Large-scale electric fields resulting from magnetic reconnection in the corona
[DE86-012391] N87-13383
MAGNETOMETERS
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
Magnetic and pressure sensors using the compensated polarimetric sensor configuration N87-13279
MAGNETOPLASMADYNAMICS
Advanced electric propulsion MPD (magnetoplasmadynamic)
[AD-A169792] N87-12610
MAGNETOSPHERE
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
Solar flares and magnetospheric particles: Investigations based upon the ONR-60 experiments and ONR-604 experiments
[AD-A170620] N87-13381
The secondary production of gamma rays in the Jovian magnetosphere N87-13391
MAGNETOSPHERIC ELECTRON DENSITY
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
MAGNETOSTRICTION
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
MAGNETRONS
Polarized H(-) source development at BNL
[DE86-012704] N87-13257
MAGNIFICATION
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
MAINTENANCE
Adhesive repair patch
[AD-D012422] N87-12692
MAN ENVIRONMENT INTERACTIONS
Desertification: Global ecological problem N87-12950
MAN MACHINE SYSTEMS
Proceedings of a Symposium on the Evaluation of Man-Machine Systems: Methods and Problems
[DGLR-85-04] N87-13146
Evaluation of man machine systems: Introduction and overview N87-13147
A method for the optimum design of the man machine interface N87-13159
The eye-mark investigation as an anthropotechnical method to study man machine systems N87-13160
Basic conceptions for the evaluation of man machine systems N87-13161
Inquiry techniques for the evaluation of man machine systems N87-13162
A measure of usability — man machine systems N87-13163
Evaluation of the bearing and knowledge requirements of man machine systems N87-13164
MAN-COMPUTER INTERFACE
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169086] N87-12729
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198
MANAGEMENT METHODS
An examination of technology transfer as a tool for management
[AD-A169184] N87-13360
MANAGEMENT PLANNING
Joint operating procedure for interrange scheduling
[AD-A169636] N87-12579
MANEUVERS
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167
MANIPULATORS
On the dexterity of robotic manipulators N87-12867
Multi use gripper for industrial robot
[AD-D012371] N87-12876
Integrating computer vision with a robot arm system
[AD-A171278] N87-12884
MANUAL CONTROL
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/216] N87-13151
MANY ELECTRON EFFECTS
Band description of materials with localizing orbitals
[DE86-010529] N87-13255
MAPPING
The space station millimeter facility
[AD-A169983] N87-12604
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/259] N87-12963
Comparison of the 1964 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Lightning mapper and the future N87-13059
Airborne atmospheric electricity experiments N87-13063
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110
Relief and geology of the north polar region of the planet Venus
[NASA-TM-88498] N87-13376
MARKET RESEARCH
Quality management: An annotated bibliography
[AD-A169816] N87-12912
MARKING
Distributed name servers: Naming and caching in large distributed computing environments
[AD-A169225] N87-13201
Data tagging in the Energy Data Base
[DE86-010621] N87-13355
MARKOV PROCESSES
Upper bounds for symmetric Markov transition functions
[AD-A170010] N87-13221
Recursive moment formulas for semi-Markov processes
[AD-A169253] N87-13231
A reversal argument for storage models defined on semi-Markov processes
[AD-A169262] N87-13232
MARTENSITE
Design of strong, ductile, HSLA and dual phase steels
[DE86-011313] N87-12665
MARTENSITIC STAINLESS STEELS
Initiation of pitting corrosion in martensitic stainless steels
[DE86-007627] N87-12661
Data requirements to model creep in 9Cr-1Mo-V steel
[DE86-011754] N87-12944

MASS
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603
MASS DISTRIBUTION
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
MASS FLOW
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
MASS SPECTROMETERS
Fragmentation dynamics of energetic materials
[AD-A169925] N87-12682
Collection of ions in the stratosphere
[AD-A169905] N87-13032
MASS SPECTROSCOPY
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
MASS TRANSFER
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12823
MATCHED FILTERS
Optical processing
[AD-A169882] N87-13269
MATCHING
A rule-based pattern matching system for the recognition of three-dimensional line drawn objects: A foundation for video tracking
[AD-A170701] N87-13190
MATERIALS HANDLING
Concept study - vehicle waste disposal system
[AD-A169045] N87-13168
MATERIALS RECOVERY
Importance of interfacial phenomena in separation science and technology
[DE86-011063] N87-12637
MATHEMATICAL MODELS
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
A numerical model for two-dimensional unsteady flow calculations with a surface panel method N87-12548
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Simplified forms of performance equations. Addendum A: Effect on aeroplane level speed of small changes in thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-12556
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta e squared))
[NASA-TM-87731] N87-12566
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12598
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169839] N87-12620
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765
SAW transduction in electrostrictive substrates
[DE86-011651] N87-12794
Generalization of one-dimensional solute transport: A stochastic-convective flow conceptualization
[DE86-011117] N87-12820
Double-ended tuning fork quartz accelerometer
[DE86-012277] N87-12842
Comparison of Rayleigh-Taylor growth with 1.0 m and 0.25 m lasers
[DE86-012217] N87-12862
Welding research in Scandinavia: An assessment
[AD-A169036] N87-12871
Linear harmonic analysis of free-piston Stirling engines
[DE86-012451] N87-12903
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
Crop yield modeling for climate impact studies. Part 1: Reasoning and results
[INPE-3967-PRE/982-PT-1] N87-12961
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103
Introduction to the theory of nested transactions
[AD-A171428] N87-13191
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230
Pattern recognition based on scale invariant discriminant functions
[AD-A170809] N87-13241
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1986
[AD-A169473] N87-13246
MATHEMATICAL PROGRAMMING
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
Maintaining LU factors of a general sparse matrix
[AD-A169255] N87-13248
MATRICES (MATHEMATICS)
Matrix factorization on a hypercube multiprocessor
[DE86-011775] N87-13193
A generalized projection method for the solution of algebraic linear systems
[INPE-3874-PRE/930] N87-13205
Eigenvectors of graphs
[AD-A170562] N87-13223
On reduction of dimensionality under multivariate regression and canonical correlation models
[AD-A170025] N87-13238
Maintaining LU factors of a general sparse matrix
[AD-A169255] N87-13248
MATRIX THEORY
Matrix theory
[AD-A169139] N87-13247
MAXIMUM LIKELIHOOD ESTIMATES
Validity of Edgeworth expansions of minimum contrast estimators for Gaussian ARMA processes
[AD-A169931] N87-13217
MAXWELL EQUATION
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865
MEAN FREE PATH
Finite mean-free-paths and the electrical resistivity of liquid simple metals and binary alloys
[DE86-702662] N87-12678
MEASURING INSTRUMENTS
Advanced optical smoke meters for jet engine exhaust measurement
[NASA-CR-179459] N87-12829
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831
A procedure for automatic treatment of dynamic systems state observation bias errors
[INPE-3906-PRE/918] N87-13177
MECHANICAL DEVICES
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
MECHANICAL PROPERTIES
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12658
Investigation of the effects of cobalt ions on epoxy properties
[NASA-TP-2639] N87-12660
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
Mechanical transduction: Unification
[AD-A171191] N87-13123
MELTING
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
MELTS (CRYSTAL GROWTH)
Incremental quench research
[AD-A169980] N87-13317
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320
MEMORY (COMPUTERS)
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314
MENTAL PERFORMANCE
Eye movements as an index of mental workload
[AD-A169941] N87-13145
MERCURY CADMIUM TELLURIDES
Incremental quench research
[AD-A169980] N87-13317
Quantum 1/F noise in solid state double devices, in particular Hg(1-x)CdxTe diodes
[AD-A171438] N87-13332
MERCURY TELLURIDES
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337
MESON-MESON INTERACTIONS
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
MESOSCALE PHENOMENA
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Deep convection in mesoscale convective systems N87-13055
Space shuttle/mesoscale lightning experiment N87-13060
Optical characteristics of lightning N87-13062
Airborne Doppler measurements of the central California extended sea breeze N87-13066
Response of the mesoscale atmosphere to diabatic heating N87-13069
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
LAMPS software and mesoscale prediction studies N87-13076
Mesoscale-cloud scale simulation of convective response N87-13077
Mesoscale research activities with the LAMPS model N87-13078
Cooperative VAS program with NASA Marshall Space Flight Center N87-13079
The assimilation of satellite soundings, winds and satellite products in a mesoscale analysis/forecast system N87-13080
Numerical simulation of convective response to mesoscale forcing N87-13081
A summary of research on mesoscale energetics of severe storm environments N87-13082
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13084
Statistical analysis and use of VAS radiance data N87-13086
Improved satellite retrievals and mesoscale moisture variability N87-13087
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
Interactive information processing for NASA's mesoscale analysis and space sensor program N87-13093
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095

METAL COATINGS
Solid-state electrochromic switchable window glazings
[DE86-004455] N87-12700
METAL CRYSTALS
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by synchrotron topography
[DE86-002968] N87-13334
METAL FATIGUE
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914
METAL FILMS
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A169963] N87-13318
METAL FLUORIDES
Preparation and properties of infrared transmitting heavy metal fluoride glass optical fibers N87-13296
Fluoride glasses for infrared waveguides N87-13299
METAL FOILS
A heater made from graphite composite material for potential deicing application
[NASA-TM-88688] N87-12559
Modeling of high-explosive driven plasma compression opening switches
[DE86-012421] N87-12795
Resistance seam welding
[DE86-013288] N87-12906
METAL HYDRIDES
Phase change thermal energy storage methods for combat vehicles, phase 1
[AD-A170492] N87-12713
METAL IONS
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
METAL JOINTS
Rusty bolt intermodulation interference reducer
[AD-D012417] N87-12691
METAL MATRIX COMPOSITES
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169639] N87-12620
METAL PLATES
Metal thickness measurements using radiography
[AD-D012373] N87-12632
METAL SHEETS
Adhesive repair patch
[AD-D012422] N87-12692
METAL SURFACES
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169618] N87-12636
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Cleaning of aluminum alloy 5083
[DE86-012573] N87-12675
Metals and Ceramics Division Materials Sciences Program
[DE86-013512] N87-12999
A constitutive law for finite element contact problems with unclassical friction
[NASA-TM-88836] N87-12924
METAL VAPORS
Characterization of the atomic emission in Inconel 718 alloy metal vapor arcs
[DE86-012178] N87-12872
METAL WORKING
Mechanics of metal forming
[DE86-012414] N87-12673
METAL-NITRIDE-OXIDE-SILICON
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175
METALLIC GLASSES
Preparation and properties of infrared transmitting heavy metal fluoride glass optical fibers N87-13296
METALS
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
Nuclear reaction analysis of hydrogen in metals
[AD-A169032] N87-12649
APFIM studies of phase transformations
[DE86-006533] N87-12663
Microstructural study of high energy density dissimilar metal welds
[DE86-009284] N87-12666
Mechanics of metal forming
[DE86-012414] N87-12673
Calculated versus experimental charge density distribution of Be metal
[AD-A169824] N87-13254
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13323
METASTABLE STATE
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12684
METEOROLOGICAL FLIGHT
Experimental research on turbulence in upper-level tropospheric clouds N87-12952
Meteorological summary of WATOX (western Atlantic Ocean experiment) 1985 research intensive, February-April
[PB86-226792] N87-13114
METEOROLOGICAL PARAMETERS
Possible military applications of stratospheric airship discussed N87-12716
Remote observations of severe storms N87-13065
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113
METEOROLOGICAL RADAR
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
A review of microburstr and their analysis and detection with Doppler radar
[AD-A170458] N87-13110
Effects of reduced spatial resolution on the NEXRAD storm sequence algorithms
[PB86-221728] N87-13117
METEOROLOGICAL SATELLITES
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169486] N87-13031
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071
The assimilation of satellite soundings, winds and satellite products in a mesoscale analysis/forecast system N87-13080
Time composite sounding N87-13083
Improved satellite retrievals and mesoscale moisture variability N87-13087
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104
METEOROLOGY
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167978] N87-12551
Meteorological effects of geotectonic phenomena hypothesized N87-12947
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
Lightning mapper and the future N87-13059
Mesoscale ageostrophic circulations associated with baroclinic jet streaks N87-13070
The meteorological interactive data display system N87-13091
A design study for a three-dimensional display computer terminal for meteorological information N87-13092
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
METHYL COMPOUNDS
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169039] N87-12693
MICHELSON INTERFEROMETERS
Measurement of atmospheric emission spectra at high altitudes
[AD-A170143] N87-13095
MICROANALYSIS
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
Site occupations in Li sub 2 ordered alloys by axial electron channeling microanalysis
[DE86-009421] N87-12669
MICROCOMPUTERS
Pulse Code Modulation (PCM) data storage and analysis using a microcomputer
[NASA-TP-2629] N87-12718
MICROELECTRONICS
Direct writing of microstructures for solid-state electronics
[AD-A170637] N87-12783
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
Heat transfer characteristics of simulated microelectronic chips under normal and enhanced conditions
[PB86-224425] N87-12804
High power semiconductor laser sources
[AD-A169900] N87-12844
MICROMECHANICS
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169639] N87-12620
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
MICROMETEOROLOGY
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103
MICROORGANISMS
The ecology of microorganisms in a small closed system: Potential benefits and problems for space station
[NASA-TM-86563] N87-13166
MICROPROCESSORS
Flight model discharge system
[AD-A169423] N87-12571
MICROSTRUCTURE
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169639] N87-12620
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169960] N87-12656
A fundamental study of P/M processed elevated temperature aluminum alloys
[AD-A170697] N87-12657
Effect of strain and strain rate on residual microstructures in copper
[DE86-007361] N87-12659
Effect of residual strain on twinning in shock-loaded copper
[DE86-007362] N87-12660
APFIM studies of phase transformations
[DE86-006533] N87-12663
Bainite in chromium-molybdenum steels
[DE86-011781] N87-12666
Microstructural study of high energy density dissimilar metal welds
[DE86-009284] N87-12666
Atomic resolution study of precipitates in an Al-Ge alloy
[DE86-011308] N87-12670
Direct writing of microstructures for solid-state electronics
[AD-A170637] N87-12783
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860
Effect of convection on weld pool shape and microstructure
[AD-A170486] N87-12863
Localized ion milling of metallic and ceramic TEM specimens
[DE86-009538] N87-12900
Incremental quench research
[AD-A169960] N87-13317
Surface green function matching for a three-dimensional non-local continuum
[DE86-702647] N87-13341

MICROWAVE AMPLIFIERS
Experimental verification of soliton theory using a microwave crossed-field amplifier
[AD-A170011] N87-12778
A 60 GHz gyrotron development program
[DE86-012488] N87-12791
MICROWAVE ANTENNAS
Dielectric antennas for millimeter-wave applications
[AD-A169865] N87-12739
MICROWAVE EMISSION
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13387
MICROWAVE EQUIPMENT
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
MICROWAVE LANDING SYSTEMS
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
MICROWAVE OSCILLATORS
Millimeter wave components — spaceborne microwave radiometers
[FTL-118521] N87-12605
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170772] N87-12781
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170831] N87-12782
MICROWAVE RADIOMETERS
Millimeter wave components — spaceborne microwave radiometers
[FTL-118521] N87-12605
Severe storm detection with passive 37 GHz observations N87-13072
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
First meeting of the Working Group on the Shuttle Microwave Precipitation Radiometer (SMPR) N87-13096
MICROWAVE TRANSMISSION
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
Performance of RF fiber optic links N87-13301
MICROWAVES
Efficient, monochromatic, high-power microwave generator
[DE86-012385] N87-12792
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13264
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A169982] N87-13318
MIDDLE ATMOSPHERE
Middle Atmosphere Program. Handbook for MAP, volume 21
[NASA-CR-179893] N87-13015
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-6, 1984 N87-13016
Proceedings of the Workshop on Atmospheric Tides, Prague, Czechoslovakia, August 14, 1985 N87-13017
Minutes of MAP/WINE experimenters meeting, Prague, Czechoslovakia, August 13, 1985 N87-13018
Coordinated study of the behavior of the middle atmosphere in winter: Monthly mean comparisons of satellite and radiosonde data and derived quantities N87-13019
Middle atmosphere modeling
[NASA-CR-179934] N87-13023
MIE SCATTERING
Measurement and calculation of the Stokes or Mueller matrix for the scattering of electromagnetic radiation from irregular particles
[AD-A171502] N87-12749
MILITARY AIR FACILITIES
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
MILITARY SPACECRAFT
MILSTAR modeling survey
[AD-A169789] N87-12600
MILITARY TECHNOLOGY
Tactical fiber optic assembly requirements N87-13305
MILITARY VEHICLES
Concept study - vehicle waste disposal system
[AD-A169045] N87-13168
MILLIMETER WAVES
Dielectric antennas for millimeter-wave applications
[AD-A169865] N87-12739
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A169982] N87-13318
Repetition rates of fast pulses in MM-waves/X-ray solar bursts
[INPE-3974-PRE/988] N87-13378
MINERAL EXPLORATION
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/250] N87-12963
MINERALOGY
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979
MINERALS
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS) N87-12978
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12981
MIRROR FUSION
Tara vacuum system
[DE86-011873] N87-13311
MIRRORS
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
Beam steering mirror construction
[AD-D012399] N87-13268
MIS (SEMICONDUCTORS)
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652
MISSILE ANTENNAS
TDD antenna: Foil formed, substrate loaded laser welded assembly
[AD-D012411] N87-12712
MISSILE COMPONENTS
Carbon fibers
[AD-A171370] N87-12622
Optical rotation sensors
[AD-A169357] N87-12848
MISSILE CONTROL
Fibre optic gyroscopes in inertial navigation N87-13275
Single-mode-fibers for fiberoptic-guided missiles: A comparison with graded-index multimode fibers N87-13303
MISSILE DESIGN
The Chinese guided missiles stride toward modernization
[AD-A169017] N87-12582
MISSILES
The Chinese guided missiles stride toward modernization
[AD-A169017] N87-12582
MISSION PLANNING
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
MISSOURI
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12983
MIXING
Recursive moment formulas for semi-Markov processes
[AD-A169253] N87-13231
MIXTURES
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
MOBILE COMMUNICATION SYSTEMS
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
MODELS
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3895-PRE/937] N87-12590
MILSTAR modeling survey
[AD-A169789] N87-12600
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169038] N87-12683
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
A reversal argument for storage models defined on semi-Markov processes
[AD-A169262] N87-13232
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-88891] N87-13359
MODULATION TRANSFER FUNCTION
Modulation Transfer Function (MTF) of the geometrical image resolution of the thermal infrared band
[INPE-3964-TDL/231] N87-12609
MODULES
Development of low-temperature transistor modules to improve the MSFC mid-infrared array
[NASA-TM-86566] N87-12756
MOISTURE
Stress effects on moisture transport in an epoxy resin and its composite
[AD-A169306] N87-12617
MOISTURE CONTENT
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
MOISTURE METERS
In-line determination of presence of liquid phase moisture in sealed IC packages
[AD-D012408] N87-12775
MOLECULAR BEAM EPITAXY
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329
MOLECULAR BEAMS
Fragmentation dynamics of energetic materials
[AD-A169925] N87-12682
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331
MOLECULAR CHAINS
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696
MOLECULAR CLOUDS
Infrared reflection nebulae in Orion molecular cloud 2
[NASA-TM-88259] N87-13363
MOLECULAR ELECTRONICS
Epitaxial crystallization and epitaxial polymerization as tools for molecular engineering
[AD-A171506] N87-13333
MOLECULAR EXCITATION
Fragmentation dynamics of energetic materials
[AD-A169925] N87-12682
Picosecond nonlinear resonant interactions in semiconductors
[AD-A170813] N87-13330
MOLECULAR INTERACTIONS
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169816] N87-12636
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169605] N87-13324
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329
MOLECULAR OSCILLATIONS
Study in molecular lasers
[AD-A169933] N87-12855
MOLECULAR OSCILLATORS
High gain free electron laser oscillators
[AD-A169002] N87-12846
MOLECULAR ROTATION
Study in molecular lasers
[AD-A169933] N87-12855
MOLECULAR STRUCTURE
Investigation of the effects of short chain processing additives on polymers
[NASA-TM-89023] N87-12614
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630

MOLYBDENUM
Bainite in chromium-molybdenum steels
[DE86-011761] N87-12666
MOMENTS
Recursive moment formulas for semi-Markov processes
[AD-A169253] N87-13231
MONOPOLE ANTENNAS
Development of a numerical procedure to treat wires attached to arbitrarily shaped conducting bodies
[AD-A169364] N87-12764
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784
MONOTECTIC ALLOYS
Cellular solidification of transparent monotectics
[NASA-CR-177039] N87-12626
MONTE CARLO METHOD
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169618] N87-12636
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12640
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
MOON
Lunar laboratory
[NASA-TM-39209] N87-12580
MORPHOLOGY
A study of the mechanism of dynamic ductile fracture of two-phase materials
[AD-A168966] N87-12925
MOSSBAUER EFFECT
Mossbauer-Bormann superradiance
[DE86-012373] N87-12866
MOUNTAINS
Use of digital Munsell color space to assist interretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980
MOUTH
Quantification of respiratory muscle performance
[AD-A169206] N87-13128
MULLITES
Low temperature formation of mullite
[AD-D012404] N87-12687
MULTICHANNEL COMMUNICATION
Multichannel phase noise measurement system
[AD-D012372] N87-13253
MULTIPATH TRANSMISSION
Foreground effects on troposcatter digital communication systems
[AD-A169350] N87-12734
Single-mode-fibers for fiberoptic-guided missiles: A comparison with graded-index multimode fibers N87-13303
MULTIPLE ACCESS
Carrier-sense stack algorithms for multiple access communication channels
[AD-A169774] N87-12738
Advanced teleprocessing systems
[AD-A170007] N87-12741
Wavelength division multiplexing at 1.5 microns for high capacity optical transmission N87-13284
MULTIPLEXING
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
Interrupt control switch interface system
[AD-D012414] N87-12776
MULTIPROCESSING (COMPUTERS)
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3958-PRE/876] N87-12720
Atmospheric Modeling And Sensor Simulation (AMASS) study N87-13090
Yield and performance enhancement through redundancy in VLSI and WSI multi-processor systems
[AD-A169930] N87-13174
MULTISENSOR APPLICATIONS
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12834
MULTISPECTRAL BAND SCANNERS
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86565] N87-12828
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
MULTISPECTRAL LINEAR ARRAYS
Progress with multiplexed sensor arrays based on reflection at spliced joints between sensors N87-13278
MULTISPECTRAL RADAR
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
MULTIVARIATE STATISTICAL ANALYSIS
On reduction of dimensionality under multivariate regression and canonical correlation models
[AD-A170025] N87-13238
A multivariate extension of Hoeffding's lemma
[AD-A170170] N87-13239
MUSCLES
Quantification of respiratory muscle performance
[AD-A169206] N87-13128
MUSCULAR STRENGTH
Quantification of respiratory muscle performance
[AD-A169206] N87-13128

N

NACELLES
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86785] N87-12558
NAMING
Distributed name servers: Naming and caching in large distributed computing environments
[AD-A169225] N87-13201
NASA PROGRAMS
NASA's quality assurance program
[GPO-63-142] N87-12909
Department of Housing and Urban Development-independent agencies appropriations for 1987, part 7
[GPO-61-970] N87-13357
NASA SPACE PROGRAMS
Earth sciences research in the Civil Space Program
[PB86-232014] N87-12995
NAVIER-STOKES EQUATION
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
NAVIGATION
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
Development of a research method to determine the quality of task mastering by navigators in ship guidance N87-13154
NAVIGATORS
Development of a research method to determine the quality of task mastering by navigators in ship guidance N87-13154
NEBULAE
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances N87-13392
NECK (ANATOMY)
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
NETWORK ANALYSIS
Availability and consistency of global information in computer networks
[AD-A169247] N87-13202
NETWORK CONTROL
MILSTAR modeling survey
[AD-A169769] N87-12600
NEUROPHYSIOLOGY
Perceptual factors in workload: A neuromagnetic study
[AD-A169934] N87-13142
NEUTRINOS
High energy neutrino absorption and its effects on stars in close X-ray binaries
[NASA-TM-89269] N87-13366
NEUTRON DIFFRACTION
Neutron diffraction studies of some rare earth-transition metal deuterides
[AD-A168995] N87-12648
NEUTRON SPECTRA
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
NEUTRON STARS
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
NEUTRONS
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
NEVADA
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS) N87-12978
Use of digital Munsell color space to assist interretation of imaging spectrometer data: Geologic examples from the northern Grapevine Mountains, California and Nevada N87-12980
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12981
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113
NEW BRUNSWICK
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030
NEW MEXICO
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
NICKEL
Radiation-induced segregation to grain boundaries in a Ni-Si alloy
[DE86-010027] N87-12664
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12676
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12866
Welding procedure specification: Gas tungsten arc welding of nickel to nickel-chromium-iron. Supplement 1: Records of procedure qualification tests
[DE86-012557] N87-12896
Electron diffraction analysis of the pentagonal arrangement of grains found in CVD pure Ni films
[DE86-009023] N87-13336
NICKEL ALLOYS
A fundamental study of P/M processed elevated temperature aluminum alloys
[AD-A170697] N87-12657
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-008494] N87-12662
Ni-Co alloy plaque for cathode of Ni-Cd battery
[AD-D012375] N87-12769
NICKEL CADMIUM BATTERIES
Aircraft battery state of charge and charge control system
[AD-A169411] N87-12766
Ni-Co alloy plaque for cathode of Ni-Cd battery
[AD-D012375] N87-12769
NICKEL STEELS
Gas tungsten arc welding of chromium-nickel steel to nickel-molybdenum-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012550] N87-12895
NICKEL ZINC BATTERIES
Zinc/nickel oxide battery membrane separator studies
[DE86-012824] N87-12793
NIMBUS 7 SATELLITE
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
Severe storm detection with passive 37 GHz observations N87-13072
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
NITRIC ACID
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
NITRO COMPOUNDS
Methods for the syntheses of mono-, di-, tri- and tetranitro derivatives of diphenylamine
[WSRL-0436-TR] N87-12702
NITROGEN FLUORIDES
Iodine monofluoride energy transfer studies
[AD-A169781] N87-12852
NITROGEN OXIDES
Remote sensing to detect ecological impacts associated with acid deposition
[DE86-011649] N87-12992

NOAA SATELLITES
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169265] N87-12991
Application of satellite data to tropic/subtropic moisture coupling N87-13053
NOISE INTENSITY
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
NOISE MEASUREMENT
Multichannel phase noise measurement system
[AD-D012372] N87-13253
NOISE PREDICTION (AIRCRAFT)
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
NOISE REDUCTION
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252
A study of methods of phase noise reduction of semiconductor lasers for sensor applications N87-13286
NOISE SPECTRA
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
Closed loop fiber optic gyro N87-13277
Effects of optical feedback on the performance of high data rate single-mode fiber systems N87-13288
NONDESTRUCTIVE TESTS
Quantitative non-destructive evaluation of composite materials based on ultrasonic wave propagation
[NASA-CR-179831] N87-12613
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12789
Metal thickness measurements using radiography
[AD-D012373] N87-12832
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12908
NONEQUILIBRIUM IONIZATION
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
NONLINEAR EQUATIONS
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
Evaluating nonlinear effects in propagation of acoustic pulse in atmospheric surface layer in inversions N87-12951
Nonlinear waves
[AD-A169934] N87-13207
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216
NONLINEAR OPTICS
Application of nonlinear optics to free electron laser systems
[AD-A169950] N87-12645
Nonlinear waves
[AD-A169934] N87-13207
Bistability in nonlinear waveguides N87-13291
Integrated optics optical limiters N87-13292
NONLINEAR PROGRAMMING
User's guide for NPSOL (version 4.0): A Fortran package for nonlinear programming
[AD-A169115] N87-13180
The continuous projective sumt method for convex programming — sequential unconstrained minimization techniques
[AD-A169847] N87-13185
Single-phase method for quadratic programming
[DE86-012156] N87-13194
Iterative methods for large linear and nonlinear least squares problems
[AD-A169026] N87-13209
NONLINEAR SYSTEMS
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
NONLINEARITY
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta e squared))
[NASA-TM-87731] N87-12566
Nonlinear waves
[AD-A169934] N87-13207
NONPARAMETRIC STATISTICS
A unified approach to constructing nonparametric rank tests
[AD-A169615] N87-13233
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236
NORMALITY
Extreme values of birth and death processes and queues
[AD-A169932] N87-13235
Smooth nonparametric quantile estimation under censoring: Simulations and bootstrap methods
[AD-A169935] N87-13236
NORTH CAROLINA
Geobotanical studies at Pilot Mountain, North Carolina using the airborne imaging spectrometer N87-12984
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103
NOZZLE DESIGN
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12863
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
NOZZLE FLOW
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
NOZZLE GEOMETRY
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
NUCLEAR BINDING ENERGY
Spherical clusters of simple metals: Madelung energies and structure
[AD-A169560] N87-13323
NUCLEAR FUSION
Compact reactor studies
[DE86-013247] N87-13263
NUCLEAR MAGNETIC RESONANCE
Transport and relaxation processes in supercritical fluids
[DE86-007847] N87-12638
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169038] N87-12683
NUCLEAR POWER PLANTS
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943
Review of the methods applied in the Federal Republic of Germany to investigate human factors in nuclear power plant control N87-13156
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157
A method for the optimum design of the man machine interface N87-13159
Compact reactor/ORC power source
[DE86-011252] N87-13260
NUCLEAR POWER REACTORS
Neutronic design studies for an unattended, low power reactor
[DE86-011226] N87-13262
NUCLEAR PUMPING
Reactor-pumped laser experiments in the Sandia SPR-3 Facility
[DE86-012183] N87-12861
NUCLEAR RADIATION
Fiber optics: A survivable and cost-effective transmission medium for terrestrial networks N87-13302
NUCLEAR REACTIONS
Nuclear reaction analysis of hydrogen in metals
[AD-A169032] N87-12649
NUCLEATION
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12684
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941
Flux spiral instability in a transport current carrying type 2 superconductor
[DE86-702724] N87-13346
NULL ZONES
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
Method and apparatus for rapid optical phasing
[AD-D012412] N87-13270
NUMERICAL ANALYSIS
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
Application of the AIPA (Approximate Iterative Preprocessing Algorithm) to F-106 data
[AD-A169084] N87-12569
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A169979] N87-12628
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821
Collection of ions in the stratosphere
[AD-A169905] N87-13032
Some investigations into variable meshes for numerical solution of partial differential equations
[AD-A169977] N87-13208
Space plasma research
[NASA-CR-178985] N87-13307
NUMERICAL INTEGRATION
Lg wave excitation and propagation in presence of one-, two- and three-dimensional heterogeneities
[AD-A169004] N87-12724
NUMERICAL WEATHER FORECASTING
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104

O

OCCULTATION
Measurement and calculation of the Stokes or Mueller matrix for the scattering of electromagnetic radiation from irregular particles
[AD-A171502] N87-12749
OCCUPATION
Site occupations in Li sub 2 ordered alloys by axial electron channeling microanalysis
[DE86-009421] N87-12669
OCEAN CURRENTS
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120
OCEAN DYNAMICS
Available potential energy in upper layer of world ocean N87-12949
OCEAN MODELS
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
OCEAN SURFACE
Available potential energy in upper layer of world ocean N87-12949
OCEANOGRAPHIC PARAMETERS
US Navy climatic study of the Caribbean Sea and Gulf of Mexico. Volume 2: East Caribbean Sea
[AD-A171487] N87-13112
OCEANOGRAPHY
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169265] N87-12991
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
OCEANS
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
OILS
Combustion and micro-explosion of water/oil emulsions in high pressure environments
[AD-A169976] N87-12627

Shower and high-pressure oil temperature control
[DE86-009398] N87-12899

ONBOARD DATA PROCESSING
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393

OPERATORS (MATHEMATICS)
Long time estimates for the heat kernel associated with a uniformly subelliptic symmetric second order operator
[AD-A169849] N87-13220

OPERATORS (PERSONNEL)
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157

OPTICAL BISTABILITY
Bistability in nonlinear waveguides N87-13291

OPTICAL COMMUNICATION
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012389] N87-13267
Single crystal fibers N87-13298

OPTICAL COMPUTERS
Optical processing
[AD-A169882] N87-13269

OPTICAL COUPLING
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289
Integrated optics optical limiters N87-13292

OPTICAL DATA PROCESSING
Optical processing
[AD-A169882] N87-13269

OPTICAL EQUIPMENT
Development of a large-aperture PLZT shutter with enhanced operational/environmental capabilities
[DE86-011643] N87-12836
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
Method and apparatus for rapid optical phasing
[AD-D012412] N87-13270
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273

OPTICAL FILTERS
Development of a large-aperture PLZT shutter with enhanced operational/environmental capabilities
[DE86-011643] N87-12836

OPTICAL GYROSCOPES
Fibre optic gyroscopes in inertial navigation N87-13275
Comparison of ring laser and fiber-optic gyro technology N87-13276
Closed loop fiber optic gyro N87-13277
Progress in optical fiber gyroscopes using integrated optics N87-13283

OPTICAL HETERODYNING
Optical quadrature demodulator for coherent detection and sensor applications N87-13287

OPTICAL MEASUREMENT
Advanced optical smoke meters for jet engine exhaust measurement
[NASA-CR-179459] N87-12829

OPTICAL MEASURING INSTRUMENTS
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86585] N87-12828
Optical rotation sensors
[AD-A169367] N87-12848
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012389] N87-13267

OPTICAL POLARIZATION
Nonlinear ellipse rotation in a low-birefringence optical fiber N87-13282

OPTICAL PROPERTIES
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
Optical characteristics of lightning and thunderstorm currents N87-13061
Optical characteristics of lightning N87-13062
Analysis of Doppler lidar data N87-13067
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012389] N87-13267
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320
Picosecond nonlinear resonant interactions in semiconductors
[AD-A169992] N87-13327

OPTICAL PUMPING
Iodine monofluoride energy transfer studies
[AD-A169781] N87-12852
Optical pumping of high power lasers with an array of plasma pinches
[AD-A169960] N87-12856

OPTICAL RADAR
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
Airborne Doppler measurements of the central California extended sea breeze N87-13066
Analysis of Doppler lidar data N87-13067
Airborne Doppler lidar activities N87-13068

OPTICAL RESONATORS
Application of nonlinear optics to free electron laser systems
[AD-A169950] N87-12845

OPTICAL SWITCHING
Optoelectronic broadband switching for communications and signal processing N87-13294

OPTICAL TRANSFER FUNCTION
Method of fabricating high efficiency binary planar optical elements
[AD-D012374] N87-13286

OPTICAL WAVEGUIDES
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
Nonlinear planar guided wave interactions and devices N87-13290
Bistability in nonlinear waveguides N87-13291
Integrated optics optical limiters N87-13292
PIN-FET preamplifier for high-speed optical transmission systems N87-13293
Glass fibres for transmission in the 8-12 micrometers waveband N87-13297
Fluoride glasses for infrared waveguides N87-13299
Wide bandwidth, long distance fibre-optic communication systems N87-13300
Tactical fiber optic assembly requirements N87-13305
A hybrid transmission scheme on single mode fibers for tactical communications N87-13306

OPTIMAL CONTROL
Optimal descending, hypersonic turn to heading
[DE86-010989] N87-12577
Attitude control of an artificial satellite by extending the linear quadratic regulator theory
[INPE-3959-PRE/977] N87-12586
The optimal linear combination of control variates in the presence of bias
[AD-A169111] N87-13210

OPTIMIZATION
A procedure for attitude determination of artificial satellites utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
Design of strong, ductile, HSLA and dual phase steels
[DE86-011313] N87-12865
The continuous projective sumt method for convex programming — sequential unconstrained minimization techniques
[AD-A169847] N87-13165
Algorithm for positive definite least square estimation of parameters
[DE86-012159] N87-13225

ORBIT CALCULATION
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575

ORBITAL ELEMENTS
Relative motion of the Sun on an artificial satellite
[INPE-3985-NTE/290] N87-12591

ORBITAL MECHANICS
Solar flux and geomagnetic activity prediction
[INPE-3984-PRE/934] N87-13377

ORBITAL POSITION ESTIMATION
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575

ORBITAL SPACE STATIONS
The space station millimeter facility
[AD-A169983] N87-12804
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167

ORBITALS
Band description of materials with localizing orbitals
[DE86-010529] N87-13255

OREGON
AIS spectra of desert shrub canopies N87-13987

ORGANIC COMPOUNDS
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12830

ORGANIZATIONS
An examination of technology transfer as a tool for management
[AD-A169184] N87-13380

ORGANOMETALLIC COMPOUNDS
Transition metal. 2: Complexes of dithiacyclopheanes
[AD-A169107] N87-12851

ORION NEBULA
Infrared reflection nebulae in Orion molecular cloud 2
[NASA-TM-86259] N87-13983

ORTHOGONALITY
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12563

OSCILLATING CYLINDERS
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815

OSCILLATING FLOW
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815

OSCILLATIONS
An experimental investigation of free-tip response to a jet
[NASA-TM-86250] N87-12539
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102

OSCILLATORS
A 60 GHz gyrotron development program
[DE86-012499] N87-12791

OUTGASSING
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310

OUTLIERS (STATISTICS)
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242

OXIDATION
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12834
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12874
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12835

OXIDATION RESISTANCE
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12818

OXYGEN PLASMA
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169478] N87-13309
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310

OXYGEN PRODUCTION
CO sub 2 laser sustained CW discharge atomic beam source
[DE86-012383] N87-12863

OZONE
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011006] N87-13040
Radiation flux tables for ICRCCM using the GLA GCM radiation codes
[NASA-TM-89270] N87-13098

OZONOSPHERE
Solar control of geophysical phenomena N87-12953

P

PACIFIC OCEAN
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052

Application of satellite data to tropic/subtropic moisture coupling N87-13053
On the Walker circulation of 1983-84
[INPE-3952-PRE/971] N87-13118
PACKET SWITCHING
Carrier-sense stack algorithms for multiple access communication channels
[AD-A169774] N87-12739
PAIR PRODUCTION
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89364] N87-13395
PALLADIUM COMPOUNDS
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012810] N87-12644
PANEL METHOD (FLUID DYNAMICS)
A numerical model for two-dimensional unsteady flow calculations with a surface panel method N87-12548
PANELS
Carbon fibers
[AD-A171370] N87-13622
PARALLEL COMPUTERS
Solving scientific problems on hypercube parallel computers
[DE86-012622] N87-13199
PARALLEL FLOW
An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow (axial force)
[BR-100271] N87-12540
PARALLEL PLATES
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12794
PARALLEL PROCESSING (COMPUTERS)
Advanced teleprocessing systems
[AD-A170007] N87-12741
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
High performance parallel computing
[AD-A169991] N87-13198
Matrix factorization on a hypercube multiprocessor
[DE86-011775] N87-13193
Solving scientific problems on hypercube parallel computers
[DE86-012622] N87-13199
PARAMETER IDENTIFICATION
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta s squared))
[NASA-TM-87731] N87-12566
PARAMETERIZATION
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
PARTIAL DIFFERENTIAL EQUATIONS
Study of numerical solution methods for two-phase flows
[DE86-012395] N87-12621
Free-Lagrangian hydrodynamics using massless tracer points
[DE86-012406] N87-12622
SOR (Successive Over-Relaxation) MGR (multigrid algorithm)(nu) experiments on the crystal multicomputer
[AD-A169929] N87-13187
Some investigations into variable meshes for numerical solution of partial differential equations
[AD-A169977] N87-13208
Quantitative assessment of the effect of partial pivoting in sparse ordinary differential equation solvers
[DE86-012992] N87-13226
PARTICLE ACCELERATION
The ultraheavy cosmic rays: Propagation and selective acceleration N87-13390
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394
PARTICLE INTERACTIONS
Electron-electron interaction effects in quasi-one-dimensional conducting polymers and related systems
[DE86-012434] N87-12697
High energy neutrino absorption and its effects on stars in close X-ray binaries
[NASA-TM-89269] N87-13366
PARTICLE PRODUCTION
High energy neutrino absorption and its effects on stars in close X-ray binaries
[NASA-TM-89269] N87-13366
PARTICLE TELESCOPES
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
PARTICLE THEORY
Theoretical high energy physics
[DE86-012969] N87-13259
PARTICLES
Solar flares and magnetospheric particles: Investigations based upon the ONR-60 experiments and ONR-604 experiments
[AD-A170620] N87-13381
PARTITIONS (STRUCTURES)
Detonation cellular structure and image process
[DE86-006467] N87-12919
PATENT APPLICATIONS
Laser sealed vacuum insulating window
[DE86-013678] N87-12701
Li corrosion resistant glasses for headers in ambient temperature Li batteries
[DE86-013784] N87-12902
Very high efficacy electrodeless high intensity discharge lamps
[DE86-013780] N87-12903
PATTERN RECOGNITION
Application of pattern recognition to metal ion chemical ionization mass spectra
[AD-A169061] N87-12630
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12906
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
A rule-based pattern matching system for the recognition of three-dimensional line drawn objects: A foundation for video tracking
[AD-A170701] N87-13190
On reduction of dimensionality under multivariate regression and canonical correlation models
[AD-A170025] N87-13238
Pattern recognition based on scale invariant discriminant functions
[AD-A170809] N87-13241
PAYLOAD RETRIEVAL (STS)
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
PERCOLATION
Percolation and low density materials: Theory and applications
[AD-A169204] N87-12684
PERFORMANCE PREDICTION
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
PERFORMANCE TESTS
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12598
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169664] N87-12711
Fault tolerance mechanisms for a network communication multiprocessor
[INPE-3958-PRE/976] N87-12720
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12799
Development of an inexpensive, high resolution positron multiwire proportional counter
[DE86-011576] N87-12841
PERIDOTITE
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975
PERIODIC VARIATIONS
On the Walker circulation of 1983-84
[INPE-3952-PRE/971] N87-13118
PERMANENT MAGNETS
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
PERMUTATIONS
A unified approach to constructing nonparametric rank tests
[AD-A169815] N87-13233
PERSONAL COMPUTERS
Simulation of CIFF (Centralized IFF) remote control displays
[AD-A170367] N87-12742
PERSONNEL
Instrumentation research and support services
[AD-A169278] N87-13029
PERTURBATION
Introduction to aerodynamics derivatives, equations of motion and stability
[ESDU-86021] N87-12536
PHARMACOLOGY
Pharmacological resetting of the circadian sleep-wake cycle
[AD-A170804] N87-13137
PHASE CHANGE MATERIALS
Phase change thermal energy storage methods for combat vehicles, phase 1
[AD-A170492] N87-12713
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
PHASE COHERENCE
Optical quadrature demodulator for coherent detection and sensor applications N87-13287
PHASE CONJUGATION
Application of nonlinear optics to free electron laser systems
[AD-A169860] N87-12946
PHASE CONTROL
Method and apparatus for rapid optical phasing
[AD-D012412] N87-13270
PHASE DEMODULATORS
Optical quadrature demodulator for coherent detection and sensor applications N87-13287
PHASE DETECTORS
Optical quadrature demodulator for coherent detection and sensor applications N87-13287
PHASE DIAGRAMS
Cellular solidification of transparent monotectics
[NASA-CR-177039] N87-12626
Phase equilibrium predictions for polar and hydrogen bonding mixtures
[DE86-011612] N87-12642
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
PHASE SHIFT
Phase fluctuations of ionosphere radio signals N87-12955
PHASE TRANSFORMATIONS
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169618] N87-12636
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
APFIM studies of phase transformations
[DE86-006533] N87-12663
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170493] N87-12937
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A169963] N87-13316
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702946] N87-13340
Astro-particle-physics
[DE86-702946] N87-13373
PHASED ARRAYS
Phased arrays 1985 symposium: Proceedings
[AD-A169016] N87-12732
Multi-element adaptive antenna array
[AD-D012410] N87-12740
Twin aperture phased array lens antenna
[AD-D012415] N87-12745
Temperature and frequency compensated array beam steering unit
[AD-D012365] N87-12767
PHONETICS
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170663] N87-12746
PHOSPHORUS
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011108] N87-12676
PHOTOABSORPTION
Electron-electron interaction effects in quasi-one-dimensional conducting polymers and related systems
[DE86-012434] N87-12697
PHOTOCATHODES
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012364] N87-12664
PHOTOCHEMICAL REACTIONS
Heterogeneous catalysis with lasers
[AD-A169601] N87-12651

Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011008] N87-13040

PHOTODECOMPOSITION
Fragmentation dynamics of energetic materials
[AD-A168925] N87-12682

PHOTODIODES
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012384] N87-12864
PIN-FET preamplifier for high-speed optical transmission systems N87-13293

PHOTOELECTRIC EFFECT
Study in molecular lasers
[AD-A169933] N87-12865

PHOTOELECTRIC EMISSION
Photoemission from oblate silver spheroids with polarized vacuum UV excitation
[DE86-009898] N87-13256

PHOTOELECTROCHEMISTRY
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996

PHOTOGRAPHIC EQUIPMENT
Photographic sensors: Basic concepts
[INPE-3990-MD/031] N87-12966

PHOTOGRAPHY
Detonation cellular structure and image proces
[DE86-006467] N87-12619

PHOTOINTERPRETATION
Patterns of vegetation in the Owens Valley, California N87-12966

PHOTOIONIZATION
Laser produced X-ray for high resolution lithography and a photoionization laser
[AD-A170782] N87-12858

PHOTOLITHOGRAPHY
High resolution optical fiber print head
[AD-D012384] N87-12833
Laser produced X-ray for high resolution lithography and a photoionization laser
[AD-A170782] N87-12858
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289

PHOTONS
Fragmentation dynamics of energetic materials
[AD-A168925] N87-12682
Resonant photon pumping mechanisms for a plasma X-ray laser
[AD-D012416] N87-12857
The secondary production of gamma rays in the Jovian magnetosphere N87-13391

PHOTORECEPTORS
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135

PHOTOSPHERE
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13367

PHOTOVOLTAIC CELLS
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010708] N87-13004
Photovoltaic Concentrator Technology Project, Fourteenth Project Integration Meeting, June 10-11, 1986
[DE86-012051] N87-13006

PHOTOVOLTAIC CONVERSION
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001

PHOTOVOLTAIC EFFECT
Status and future of government-supported amorphous silicon research in the US
[DE86-010702] N87-12997

PHYSICAL FITNESS
Self-paced heat acclimation procedures
[AD-A170533] N87-13134

PHYSIOLOGICAL EFFECTS
Crew factors in flight operations. Part 3: The operational significance of exposure to short-haul air transport operations
[NASA-TM-88322] N87-13122
Mechanical transduction: Unification
[AD-A171191] N87-13123
Application of heart rate measurements to maritime research simulator
[AD-A169968] N87-13132

PHYSIOLOGICAL RESPONSES
Analysis of head and neck dynamic response of the US adult military population
[AD-A169563] N87-13129
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131

PHYSIOLOGY
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167

PICOSECOND PULSES
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779

PIEZOELECTRICITY
SAW transduction in electrostrictive substrates
[DE86-011651] N87-12794

PILOT ERROR
Aircraft accident report: Bar Harbor Airlines Flight 1808, Beech BE-99, N300WP, Auburn-Lewiston Municipal Airport, Auburn, Maine, August 25, 1985
[PB86-910408] N87-12550

PILOT PERFORMANCE
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
The Flight Service Station Training Program: 1981-1985
[AD-A171485] N87-13145
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/216] N87-13151

PILOT TRAINING
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
The Flight Service Station Training Program: 1981-1985
[AD-A171485] N87-13145

PIPE FLOW
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805

PIPELINING (COMPUTERS)
ERS-1 SAR data processing
[NASA-CR-179913] N87-12965

PIPES (TUBES)
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
Gas tungsten arc welding of chromium-nickel steel to nickel-molybdenum-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012550] N87-12895
Welding procedure specification: Gas tungsten arc welding of nickel to nickel-chromium-iron. Supplement 1: Records of procedure qualification tests
[DE86-012557] N87-12896
Gas tungsten arc welding of aluminum alloys 3004, 5052 and 5x54 to 6xxx. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012561] N87-12897

PISTON ENGINES
Diesel cylinder gas-side heat flux to a ceramic surface
[AD-A168948] N87-12870
Linear harmonic analysis of free-piston Stirling engines
[DE86-012451] N87-12903

PITCH (MATERIAL)
Process for carbon-carbon composite fabrication
[AD-D012413] N87-12621
Effects of graphitization on the environmental stability of brominated pitch-based fibers
[NASA-TM-88699] N87-12679

PITCHING MOMENTS
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546

PITTING
Initiation of pitting corrosion in martensitic stainless steels
[DE86-007627] N87-12861

PLANE WAVES
Computer programs for electromagnetic scattering from a slotted TM cylindrical conductor by the pseudo-image method
[AD-A169016] N87-12725
Two-dimensional beamforming using a frequency domain complex Least Mean-Squares (LMS) adaptive filter
[AD-A171396] N87-12785
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169269] N87-12931

PLANTS (BOTANY)
Trace element-induced stress in freshwater we vegetation: Preliminary results N87-1
Characterization of information requirements for st of CO2 effects: Water resources, agriculture, fishe forests and human health
[DE86-012477] N87-1
Direct effects of atmospheric CO2 enrichment on p and ecosystems: A bibliography with abstracts
[DE86-013525] N87-1

PLASMA CLOUDS
Ionization phenomena about the space shuttle
[AD-A170542] N87-1

PLASMA COMPRESSION
Modeling of high-explosive driven plasma compres opening switches
[DE86-012421] N87-12

PLASMA CONTROL
Tara vacuum system
[DE86-011873] N87-13

PLASMA DENSITY
Optical pumping of high power lasers with an arra plasma pinches
[AD-A169960] N87-12

PLASMA DIAGNOSTICS
MAX '91: An advanced payload for the exploratio high energy processes on the active sun
[NASA-TM-89271] N87-13

PLASMA DYNAMICS
Magnetospheric plasma studies using data from dynamics explorer high and low altitude plas instruments
[AD-A169010] N87-13

PLASMA FOCUS
Optical pumping of high power lasers with an array plasma pinches
[AD-A169960] N87-12

PLASMA INTERACTIONS
Ionization phenomena about the space shuttle
[AD-A170542] N87-13

PLASMA JETS
Plasma-enhanced deposition and processing transition metals and transition metal silicides for V
[AD-A168963] N87-13

PLASMA PHYSICS
Space plasma research
[NASA-CR-179965] N87-13

PLASMA PINCH
Optical pumping of high power lasers with an array plasma pinches
[AD-A169960] N87-12

PLASMA PUMPING
Tara vacuum system
[DE86-011873] N87-13

PLASMA RADIATION
Models and radiation of railgun plasma armatures w non-ideal plasma properties
[AD-A169349] N87-132
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-133

PLASMA WAVES
Two-dimensional dynamics of the plasma Wakefie accelerator
[DE86-012352] N87-133

PLASMAS (PHYSICS)
Plasma assisted surface coating/modificatio processes: An emerging technology
[NASA-TM-88865] N87-1270
A variational principle for the plasma centrifuge
[INPE-3989-PRE/992] N87-1282
Two-dimensional dynamics of the plasma Wakefie accelerator
[DE86-012382] N87-1331
Large-scale electric fields resulting from magnet reconnection in the corona
[DE86-012391] N87-1336

PLASMASPHERE
Magnetospheric plasma studies using data from th dynamics explorer high and low altitude plasm instruments
[AD-A169010] N87-1302

PLASTIC DEFORMATION
Effect of hydrogen on the mechanical properties an fracture behavior of high purity aluminum
[AD-A171214] N87-1265

PLASTIC FLOW
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-1292

PLASTIC PROPERTIES
MAGNA (Materially And Geometrically Nonlinea Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-1293

PLASTICIZERS
Preparation of energetic compounds
[AD-A170022] N87-1270

PLASTICS
Carbon fibers
[AD-A171370] N87-12622
PLATEAUS
Remote sensing of severe convective storms
N87-13075
PLATINUM
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169136] N87-12633
PLOTTERS
Using 3-dimensional graphics to visualize multivariate scientific data
[DE86-010788] N87-13195
PLOTTING
Using 3-dimensional graphics to visualize multivariate scientific data
[DE86-010788] N87-13195
PNEUMATIC CONTROL
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
POISSON DENSITY FUNCTIONS
Extremal processes, record times and strong approximation
[AD-A169972] N87-13237
POLAR CAPS
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
POLAR REGIONS
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031
Relief and geology of the north polar region of the planet Venus
[NASA-TM-86496] N87-13376
POLARIMETERS
Magnetic and pressure sensors using the compensated polarimetric sensor configuration N87-13279
POLARIZATION (CHARGE SEPARATION)
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652
POLARIZATION (WAVES)
Electrode/electrolyte interphase study using polarization modulated FT-IR reflection absorption spectroscopy
[AD-A169061] N87-12631
Photoemission from oblate silver spheroids with polarized vacuum UV excitation
[DE86-008896] N87-13256
POLARIZED ELECTROMAGNETIC RADIATION
Propagation of electromagnetic waves in superlattices
[DE86-702660] N87-12753
Investigations of long-period DQ Herculis star
N87-13364
POLICIES
Report of the Ad-Hoc Commission on remote sensing
[INPE-3961-NTE/259] N87-12963
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13361
POLLUTION CONTROL
Southern California Air Quality Study (SCAQS) suggested program plan
[PB86-223427] N87-13013
POLLUTION TRANSPORT
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220357] N87-13014
POLYACETYLENE
Physical characteristics of diblock polyacetylene copolymers: Processability-conductivity correlation
[DE86-011218] N87-12695
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696
POLYCRYSTALS
Microchemical analysis of polycrystalline Ni3Al and other ordered alloys using the field-ion microscope atom probe
[DE86-013157] N87-12677
Stable, high-efficiency, CuInSe2-based polycrystalline thin-film tandem solar cells
[DE86-010705] N87-13003
POLYGONS
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-86324] N87-12967
POLYIMIDES
Investigation of the effects of short chain processing additives on polymers
[NASA-TM-89023] N87-12614
POLYMER CHEMISTRY
Coupled damage and moisture-transport in fiber-reinforced polymeric composites
[AD-A169379] N87-12619
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996
POLYMERIC FILMS
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996
POLYMERIZATION
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
Effect of chain rigidity on conductivity of conjugated polymers
[DE86-011263] N87-12696
Epitaxial crystallization and epitaxial polymerization as tools for molecular engineering
[AD-A171506] N87-13333
POLYMERS
Electron-electron interaction effects in quasi-one-dimensional conducting polymers and related systems
[DE86-012434] N87-12697
POLYNOMIALS
Matrix theory
[AD-A169139] N87-13247
POLYPROPYLENE
Zinc/nickel oxide battery membrane separator studies
[DE86-012624] N87-12793
POLYSTYRENE
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
Physical characteristics of diblock polyacetylene copolymers: Processability-conductivity correlation
[DE86-011218] N87-12695
POPULATION INVERSION
Population inversions in laser-initiated vacuum arcs
[AD-A170611] N87-12859
POROSITY
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
POROUS MATERIALS
Process for carbon-carbon composite fabrication
[AD-D012413] N87-12621
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818
PORTS (OPENINGS)
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
Viewport concept for space station modules
[NASA-TM-86559] N87-12592
POSITION (LOCATION)
Severe storm electricity N87-13056
Storm severity detection (RF) N87-13057
Lightning mapper and the future N87-13059
Detection of rotating thunderstorms using satellite imagery N87-13085
POTENTIAL ENERGY
Circuit considerations for repetitive railguns
[DE86-012369] N87-12752
Molecular dynamic studies of crack propagation. The role of the interatomic potential
[DE86-009942] N87-12942
Available potential energy in upper layer of world ocean N87-12949
POWDER (PARTICLES)
Real-time experimental measurements of isotopic exchange between gaseous hydrogen and palladium hydride powder
[DE86-012610] N87-12644
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12688
POWDER METALLURGY
A fundamental study of P/M processed elevated temperature aluminum alloys
[AD-A170697] N87-12657
POWDERED ALUMINUM
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656
POWER CONDITIONING
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
PREAMPLIFIERS
PIN-FET preamplifier for high-speed optical transmission systems N87-13293
PRECESSION
Low Q spin-up from rest
[AD-A169108] N87-12813
PRECIPITATION
Severe storm detection with passive 37 GHz observations N87-13072
LAMPS software and mesoscale prediction studies
N87-13076
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
PRECIPITATION (METEOROLOGY)
Station climatic summaries, Europe
[AD-A167888] N87-13100
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106
Some proposals for modifying the Probability of Precipitation Program of the National Weather Service
[PB86-226636] N87-13115
PREDICTION ANALYSIS TECHNIQUES
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12676
Reliability prediction models for mechanical equipment
[AD-A169775] N87-12911
Conversion of the NOLAPS (Navy Operational Local Atmospheric Prediction System) model to the HP9845
[AD-A169538] N87-13108
Computer-based estimation procedure for coaxial jet noise. Including far-field subsonic jet mixing noise database for stationary, coplanar conical nozzles
[ESDU-86019] N87-13251
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169806] N87-13324
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169185] N87-13350
Solar flux and geomagnetic activity prediction
[INPE-3884-PRE/934] N87-13377
PREDICTIONS
Research on mechanical properties for engine life prediction
[AD-A169570] N87-12563
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
Some proposals for modifying the Probability of Precipitation Program of the National Weather Service
[PB86-226636] N87-13115
Effects of reduced spatial resolution on the NEXRAD storm sequence algorithms
[PB86-221728] N87-13117
PREPROCESSING
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
PRESSES
TDD antenna: Foil formed, substrate loaded laser welded assembly
[AD-D012411] N87-12712
PRESSURE DISTRIBUTION
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
PRESSURE EFFECTS
Optical spectroscopy of dynamically compressed liquids
[AD-A169013] N87-12629
PRESSURE MEASUREMENT
High accuracy standards and reference methodology for carbon dioxide in air
[DE86-012643] N87-13011
PRESSURE OSCILLATIONS
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805
PRESSURE SENSORS
Supplementary calibration test of the tip-aerodynamics- and acoustics-test pressure transducers
[NASA-TM-88312] N87-12830
Magnetic and pressure sensors using the compensated polarimetric sensor configuration N87-13279
PRESSURE SUITS
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
Improved anti-G suit
[AD-D012378] N87-13171
PRESSURE VESSELS
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12886

Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12888
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012536] N87-12892
Buffered explosions in steel pressure vessels
[DE86-008782] N87-12898

PRIMARY BATTERIES
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12789

PRIMATES
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126

PRINTED CIRCUITS
Review of robotic component insertion system for printed wiring assemblies
[DE86-013510] N87-12907

PRINTERS
High resolution optical fiber print head
[AD-D012384] N87-12833

PRINTERS (DATA PROCESSING)
Utilization of impact dot matrix printers
[INPE-3991-RPE/518] N87-13173

PRINTING
High resolution optical fiber print head
[AD-D012384] N87-12833

PROBABILITY DENSITY FUNCTIONS
Characteristics of atmospheric turbulence near the ground. Part 3: Variations in space and time for strong winds (neutral atmosphere)
[ESDU-86010-PT-3] N87-13042

PROBABILITY DISTRIBUTION FUNCTIONS
A reversal argument for storage models defined on semi-Markov processes
[AD-A169262] N87-13232
Pattern recognition based on scale invariant discriminant functions
[AD-A170809] N87-13241

PROBABILITY THEORY
Inequalities for probability contents of convex sets via geometric average
[AD-A169938] N87-13219
Extremal processes, record times and strong approximation
[AD-A169972] N87-13237
A Bayesian approach to quantile and response probability estimation with applications in reliability
[AD-A170455] N87-13240

PROBLEM SOLVING
SSME main injector 4000 Hertz phenomenon
[NASA-CR-178934] N87-12808
A finite element method for localized failure analysis
[AD-A169117] N87-12930
An implicit enumeration algorithm with binary-valued constraints
[AD-A169256] N87-13182
SOAR user's manual
[AD-A169005] N87-13204
Performance analysis of some numerical algorithms in the resolution of ODEs artificial satellite problems
[INPE-3998-PRE/995] N87-13206
Federal information systems management: Problems, solutions and more problems
[AD-A171366] N87-13353

PROCEDURES
Collection of ions in the stratosphere
[AD-A169905] N87-13032

PROCESS CONTROL (INDUSTRY)
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910
System-ergonomic workload analysis for highly automated process control tasks N87-13152

PRODUCTION ENGINEERING
Welding research in Scandinavia: An assessment
[AD-A169096] N87-12871

PRODUCTIVITY
Quality management: An annotated bibliography
[AD-A169816] N87-12912

PROFILOMETERS
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13097

PROGRAM VERIFICATION (COMPUTERS)
Proceedings of the IDA Workshop on Formal Specification and Verification of Ada (trade name) (1st) held in Alexandria, Virginia on 18-20 March 1985
[AD-A171507] N87-13192

PROGRAMMING LANGUAGES
Interpretive model for a concurrency method
[DE86-012743] N87-13197
Survey of the characteristics of very high level languages
[DE86-012240] N87-13198

PROJECT MANAGEMENT
Department of Housing and Urban Development-independent agencies appropriations for 1987, part 7
[GPO-61-970] N87-13357

PROJECTILES
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12584
Circuit considerations for repetitive railguns
[DE86-012369] N87-12752
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A169946] N87-13245

PROMINENCES
Magnetic field re-arrangement after prominence eruption
[DE86-012393] N87-13382

PROPELLER EFFICIENCY
Propellar/body interaction for thrust and drag
[ESDU-86017] N87-12537

PROPELLERS
Propellar/body interaction for thrust and drag
[ESDU-86017] N87-12537

PROPORTIONAL COUNTERS
Development of an inexpensive, high resolution positron multiwire proportional counter
[DE86-011576] N87-12841

PROPRIOCEPTION
Mechanical transduction: Unification
[AD-A171191] N87-13123

PROTECTIVE COATINGS
Semiconductor/insulator films for corrosion protection
[AD-A169119] N87-12652
Plasma assisted surface coating/modification processes: An emerging technology
[NASA-TM-88865] N87-12708

PROTON BEAMS
Radiation-induced segregation to grain boundaries in a Ni-Si alloy
[DE86-010027] N87-12664

PROTON FLUX DENSITY
The secondary production of gamma rays in the Jovian magnetosphere N87-13391

PROTOSTARS
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances N87-13392

PROTOTYPES
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
The evaluation of a number of prototypes for the free-tip rotor constant-moment controller
[NASA-TM-88664] N87-12869
Development of a sensitive superconducting gravity gradiometer for geological and navigational applications
[NASA-CR-4011] N87-13021

PSYCHOPHYSIOLOGY
Limits of pattern discrimination in human vision
[AD-A170758] N87-13135

PULSE CODE MODULATION
Pulse Code Modulation (PCM) data storage and analysis using a microcomputer
[NASA-TP-2629] N87-12718

PULSE COMMUNICATION
Foreground effects on troposcatter digital communication systems
[AD-A169380] N87-12734

PULSE GENERATORS
Coordinated research program in pulsed power physics
[AD-A169113] N87-12762
Nanosecond spark gap switching measurements
[DE86-012279] N87-12790
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796

PULSED LASERS
Picosecond nonlinear resonant interactions in semiconductors
[AD-A170813] N87-13330

PULSED RADIATION
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860
Repetition rates of fast pulses in MM-waves/X-ray solar bursts
[INPE-3974-PRE/986] N87-13378
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13387

PURIFICATION
Importance of interfacial phenomena in separation science and technology
[DE86-011063] N87-12637

PURITY
Effect of hydrogen on the mechanical properties and fracture behavior of high purity aluminum
[AD-A171214] N87-12868

PYRANOMETERS
Studies of humid continental haze during SPACE N87-13066

PYROLYSIS
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706

PYROMETALLURGY
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12660

PYROTECHNICS
Effects of variables upon pyrotechnically induced shock response spectra
[NASA-TP-2603] N87-12921

Q

Q FACTORS
Low Q spin-up from rest
[AD-A169106] N87-12813
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030

QUADRATIC PROGRAMMING
User's guide for NPSOL (version 4.0): A Fortran package for nonlinear programming
[AD-A169115] N87-13180
An implicit enumeration procedure for the general linear complementarity problem
[AD-A170397] N87-13189
Single-phase method for quadratic programming
[DE86-012156] N87-13194

QUALIFICATIONS
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12887
Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12888
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12890
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12891
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012536] N87-12892

QUALITY CONTROL
NASA's quality assurance program
[GPO-63-142] N87-12909
Photovoltaic Concentrator Technology Project. Fourteenth Project Integration Meeting, June 10-11, 1986
[DE86-012051] N87-13006
Quality assessment and control of finite element solutions
[NASA-TM-89206] N87-13227

QUANTILES
A Bayesian approach to quantile and response probability estimation with applications in reliability
[AD-A170455] N87-13240

QUANTUM CHEMISTRY
Heterogeneous catalysis with lasers
[AD-A169601] N87-12851

Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169605] N87-13324

QUANTUM CHROMODYNAMICS
Theoretical high energy physics
[DE86-012669] N87-13259

QUANTUM ELECTRODYNAMICS
Quantum 1/F noise in solid state double devices, in particular Hg(1-x)CdxTe diodes
[AD-A171438] N87-13332

QUANTUM THEORY
Metrics of closed world of Friedmann, agitated by electric charge (towards a theory electromagnetic Friedmann's)
[AD-A169981] N87-12723
Heterogeneous catalysis with lasers
[AD-A169601] N87-12851
Induced quantum torsion
[DE86-702616] N87-13348
Canonical quantization of gravity
[DE86-702615] N87-13372

QUARTZ
Double-ended tuning fork quartz accelerometer
[DE86-012277] N87-12642
Quartz growth on X-seeds
[AD-D012269] N87-13315

QUASARS
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368

QUENCHING (COOLING)
Shower and high-pressure oil temperature control
[DE86-009398] N87-12899

QUEUEING THEORY
Advanced teleprocessing systems
[AD-A170037] N87-12741
Heredity of stationary and reversible stochastic processes
[AD-A169926] N87-13234
Extreme values of birth and death processes and queues
[AD-A169932] N87-13235

R

RABBITS
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127

RADAR
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733

RADAR CROSS SECTIONS
Radar cross-section of damped cylinders and dielectric strips
[AD-A169027] N87-12726
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733

RADAR DETECTION
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
Obstacle-warning radar for helicopters N87-13149

RADAR ECHOES
Deep convection in mesoscale convective systems
N87-13055

RADAR EQUIPMENT
Tracking servo compensator with rate aiding
[AD-D012388] N87-12735

RADAR IMAGERY
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-88324] N87-12967

RADAR MAPS
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-88324] N87-12967

RADAR MEASUREMENT
Proceedings of the Workshop on Atmospheric Tides, Prague, Czechoslovakia, August 14, 1985 N87-13017
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13031

RADAR RANGE
A computational method to model radar return range in a polygonally based, computer-generated-imagery simulation
[NASA-TM-88324] N87-12967
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012389] N87-13267

RADAR SCATTERING
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733

RADAR TRACKING
Tracking servo compensator with rate aiding
[AD-D012388] N87-12735
A rule-based pattern matching system for the recognition of three-dimensional line drawn objects: A foundation for video tracking
[AD-A170701] N87-13190

RADAR TRANSMISSION
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737

RADIANT FLUX DENSITY
Radiation flux tables for ICRCCM using the GLA GCM radiation codes
[NASA-TM-89270] N87-13096

RADIATION ABSORPTION
High energy neutrino absorption and its effects on stars in close X-ray binaries
[NASA-TM-89269] N87-13356

RADIATION BELTS
Characterization of the gamma radiation in space and in the atmosphere
[DE86-013445] N87-13397

RADIATION DAMAGE
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331

RADIATION DETECTORS
X-ray data booklet, revision
[DE86-012650] N87-13272

RADIATION DOSAGE
Biological and clinical dosimetry, July 1, 1984 to December 31, 1984
[DE86-006947] N87-13138

RADIATION EFFECTS
Densification of graphites by irradiation
[DE86-010026] N87-12698
Metals and Ceramics Division Materials Sciences Program
[DE86-013512] N87-12699
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038
Physical interaction of 1-Hz to 100 kHz electric and magnetic fields with living organisms
[DE86-012323] N87-13139
Fiber optics: A survivable and cost-effective transmission medium for terrestrial networks N87-13302

RADIATION MEASUREMENT
Measurement and calculation of the Stokes or Mueller matrix for the scattering of electromagnetic radiation from irregular particles
[AD-A171502] N87-12749

RADIATION PROTECTION
Space nuclear safety program
[DE86-012767] N87-13261

RADIATION SHIELDING
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111

RADIATION SOURCES
Efficient, monochromatic, high-power microwave generator
[DE86-012385] N87-12792

RADIATIVE HEAT TRANSFER
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A169979] N87-12628

RADIATIVE TRANSFER
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038

RADIO ASTRONOMY
The space station millimeter facility
[AD-A169963] N87-12604

RADIO BEACONS
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169788] N87-12554
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599

RADIO FREQUENCIES
Stabilizing effects of finite-amplitude RF waves on the interchange instability
[DE86-013042] N87-12751
Unique mechanizations to fault isolate failures of an electron tube Radio Frequency (RF) amplifier and its high voltage power supply
[AD-D012376] N87-12770
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012384] N87-12664

RADIO FREQUENCY INTERFERENCE
Rusty bolt intermodulation interference reducer
[AD-D012417] N87-12691

RADIO INTERFEROMETERS
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178

RADIO SIGNALS
Effect of pulsating aurorae on frequency-time characteristics of radio signals reflected from auroral ionosphere N87-12954
Phase fluctuations of ionosphere radio signals
N87-12955

RADIO SOURCES (ASTRONOMY)
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368

RADIO WAVES
Spatial radio wave attenuation during vertical sounding of ionosphere N87-12958

RADIOACTIVE DECAY
Low Q spin-up from rest
[AD-A169106] N87-12813

RADIOACTIVE WASTES
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113

RADIOGRAPHY
Metal thickness measurements using radiography
[AD-D012373] N87-12832
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910

RADIOMETERS
Studies of humid continental haze during SPACE
N87-13088

RADIOMETRIC CORRECTION
Radiometric calibration of the airborne imaging spectrometer N87-12969

RAILGUN ACCELERATORS
Circuit considerations for repetitive railguns
[DE86-012369] N87-12752
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258

RAIN
Estimation of precipitation from GOES IR imagery during FGGE: Application to diagnostic studies N87-13048
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
Remote sensing of severe convective storms
N87-13075
First meeting of the Working Group on the Shuttle Microwave Precipitation Radiometer (SMPR)
N87-13096

RAIN FORESTS
Energy receipt partitioning over the Amazon forest
[INPE-3960-PRE/990] N87-12962
Comparison of tropical forest surveys
[DE86-011699] N87-12993
A partition of sensible and latent heat fluxes above the terra firma area in the Amazon forest
[INPE-3949-PRE/970] N87-13008

RAIN GAGES
Estimation of precipitation from GOES IR imagery during FGGE: Application to diagnostic studies N87-13048

RAMAN SPECTRA
Raman spectroscopic investigation of molecular hydrogen
[DE86-012836] N87-12846
Raman spectroscopy of carboranes and polycarboranesiloxanes
[DE86-009030] N87-12694
Photoemission from oblate silver spheroids with polarized vacuum UV excitation
[DE86-008899] N87-13256

RAMAN SPECTROSCOPY
Optical diagnostics for diesel engine applications
[DE86-010747] N87-12641

Double-resonance techniques for high-resolution Raman-spectroscopy
[DE86-009640] N87-12645
Raman spectroscopy of carboranes and polycarboranesiloxanes
[DE86-009030] N87-12694

RANDOM ACCESS MEMORY
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175

RANDOM VARIABLES
Note on a characterization of exponential distributions
[AD-A169896] N87-13215
Inequalities for probability contents of convex sets via geometric average
[AD-A169938] N87-13219
A multivariate extension of Hoeffding's lemma
[AD-A170170] N87-13239

RANGES (FACILITIES)
Directory of range data conversion and processing system, revision
[AD-A169629] N87-12578
Joint operating procedure for interrange scheduling
[AD-A169636] N87-12579

RANK TESTS
A unified approach to constructing nonparametric rank tests
[AD-A169815] N87-13233

RANKINE CYCLE
Compact reactor/ORC power source
[DE86-011252] N87-13260
Neutronic design studies for an unattended, low power reactor
[DE86-011228] N87-13262

RARE EARTH COMPOUNDS
Neutron diffraction studies of some rare earth-transition metal deuterides
[AD-A168995] N87-12648

RAWINSONDES
Variation objective analyses for cyclone studies N87-13050

RAY TRACING
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737

RAYLEIGH NUMBER
Application of flux-corrected transport (FCT) to high Rayleigh number natural convection in a porous medium
[DE86-004603] N87-12818

RAYLEIGH SCATTERING
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034

RAYLEIGH WAVES
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034

REACTION KINETICS
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169618] N87-12636
Heterogeneous catalysis with lasers
[AD-A169601] N87-12651

REACTION TIME
Sleepability and wakeability following sleep deprivation
[AD-A169578] N87-13130
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170

REACTIVITY
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127

REACTOR CORES
Neutronic design studies for an unattended, low power reactor
[DE86-011228] N87-13262

REACTOR DESIGN
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157
Compact reactor studies
[DE86-013247] N87-13263

REACTOR MATERIALS
Application of hydrogen embrittlement models to the crack growth behavior of fusion reactor materials
[DE86-011614] N87-12671
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943

REACTOR SAFETY
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157
Space nuclear safety program
[DE86-012767] N87-13261

REACTOR TECHNOLOGY
Japan report: Science and Technology
[JPRS-JST-86-023] N87-12715

REAL TIME OPERATION
A VLSI-based high-performance raster image system
[AD-A169068] N87-12761
ERS-1 SAR data processing
[NASA-CR-179913] N87-12965
Coordinated radar and satellite studies of ionospheric currents in the auroral zone and polar cap
[AD-A169466] N87-13091
Tool to develop real time simulation systems
[INPE-3979-TDL/233] N87-13179

RECEIVERS
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012389] N87-13267

RECEPTORS (PHYSIOLOGY)
Mechanical transduction: Unification
[AD-A171191] N87-13123

RECOMBINATION REACTIONS
Study in molecular lasers
[AD-A169933] N87-12855
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314
Quantum 1/F noise in solid state double devices, in particular Hg(1-x)CdxTe diodes
[AD-A171438] N87-13332

RECONSTRUCTION
Reconstruction of undersampled periodic signals
[AD-A168897] N87-12722

RECORDS
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12887
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12890
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12891

RECRYSTALLIZATION
Recrystallization behavior of ion beam modified Alpha-Al sub 2 O sub 3
[DE86-009353] N87-13335

RECTANGULAR WINGS
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544

RECURSIVE FUNCTIONS
Adaptive grid techniques for elliptic fluid-flow problems
[AD-A169471] N87-12814
Recursive moment formulas for semi-Markov processes
[AD-A169253] N87-13231
A reversal argument for storage models defined on semi-Markov processes
[AD-A169262] N87-13232

REDUCTION
Effects of reduced spatial resolution on the NEXRAD storm sequence algorithms
[PB86-221729] N87-13117

REDUNDANCY ENCODING
Yield and performance enhancement through redundancy in VLSI and WSI multi-processor systems
[AD-A169930] N87-13174

REENTRY GUIDANCE
Optimal descending, hypersonic turn to heading
[DE86-010989] N87-12577

REENTRY VEHICLES
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603

REFLECTANCE
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13264

REFLECTOMETERS
Progress with multiplexed sensor arrays based on reflection at spliced joints between sensors N87-13279

REFRACTIVITY
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
Nonlinear ellipse rotation in a low-birefringence optical fiber N87-13282

REFRACTORY MATERIALS
Carbon fibers
[AD-A171370] N87-12822

REFRIGERATING
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013639] N87-12714

REGENERATORS
Analysis of magnetic refrigeration systems with staged regenerators based on an idealized magnetic material entropy model: 1
[DE86-013636] N87-12714

REGRESSION ANALYSIS
Determination of the coefficient of thermal expansion of JP-4 fuels
[AD-A171495] N87-12705
Crop yield modeling for climate impact studies. Part 1: Reasoning and results
[INPE-3967-PRE/982-PT-1] N87-12961
Comparison of various techniques for calibration of AIS data N87-12970
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-8, 1984 N87-13016
Validity of Edgeworth expansions of minimum contrast estimators for Gaussian ARMA processes
[AD-A169931] N87-13217
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230
Regression models of quarterly overhead costs for six government aerospace contractors
[AD-A169185] N87-13350

RELATIVISTIC THEORY
Metrics of closed world of Friedmann, agitated by electric charge (towards a theory electromagnetic Friedmann's)
[AD-A168981] N87-12723

RELATIVITY
Induced quantum torsion
[DE86-702618] N87-13348

RELAXATION (MECHANICS)
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002966] N87-13334

RELAXATION METHOD (MATHEMATICS)
SOR (Successive Over-Relaxation) MGR (multigrid algorithm)(nu) experiments on the crystal multicomputer
[AD-A169929] N87-13187

RELIABILITY
In-line determination of presence of liquid phase moisture in sealed IC packages
[AD-D012408] N87-12775
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910
A Bayesian approach to quantile and response probability estimation with applications in reliability
[AD-A170455] N87-13240
Compact reactor/ORC power source
[DE86-011252] N87-13260

RELIABILITY ANALYSIS
Lithium Ambient-Temperature Battery Reliability Program, May 1983-April 1985
[DE86-012247] N87-12789
Reliability prediction models for mechanical equipment
[AD-A169775] N87-12911
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/216] N87-13151

RELIEF VALVES
Shock absorbing device with integral pressure relief valve
[AD-D012379] N87-12877

REMOTE CONTROL
Simulation of CIFF (Centralized IFF) remote control displays
[AD-A170367] N87-12742

REMOTE SENSING
Geologic remote sensing at INPE: An overview
[INPE-3975-PRE/987] N87-12969

Evaluation of remote sensing techniques to the detection of changes in a fluvial system due to human influence: The example of Canas River Basin (Sao Paulo State, Brazil)
[INPE-3970-PRE/963] N87-12080
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/258] N87-12963
Photographic sensors: Basic concepts
[INPE-3990-MD/031] N87-12966
In retrospect: The impact of research production in the area of remote sensing
[INPE-3987-NTE/261] N87-12968
Report on the activities of the irrigated crop survey in Sao Paulo State from remote sensing products, phase 2
[INPE-3950-RPE/513] N87-12969
Remote sensing to detect ecological impacts associated with acid deposition
[DE86-011649] N87-12992
Remote sensing of severe convective storms N87-13075
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
Interactive information processing for NASA's mesoscale analysis and space sensor program N87-13093
Fiber optic device for temperature remote sensing N87-13280

REMOTE SENSORS
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169255] N87-12991
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
Progress in optical fiber sensors N87-13274
Optical fiber sensors for the measurement of pulsed electric currents N87-13281

REMOVAL
Light socket removal tool
[AD-D012368] N87-12710

REPORTS
Middle Atmosphere Program. Handbook for MAP, volume 21
[NASA-CR-179893] N87-13015

REQUIREMENTS
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
Evaluation of the bearing and knowledge requirements of man machine systems N87-13164
Advanced EVA system design requirements study
[NASA-CR-171942] N87-13167

RESCUE OPERATIONS
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599

RESEARCH AND DEVELOPMENT
Status of laser enrichment technology updated N87-12717
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1985
[AD-A169473] N87-13246

RESEARCH MANAGEMENT
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
Quality management: An annotated bibliography
[AD-A169816] N87-12912
In retrospect: The impact of research production in the area of remote sensing
[INPE-3987-NTE/261] N87-12968
Southern California Air Quality Study (SCAQS) suggested program plan
[PB88-223427] N87-13013
Instrumentation research and support services
[AD-A169278] N87-13029

RESERVOIRS
Multiple rate shock isolator damping valve
[AD-D012394] N87-12679

RESIDUAL STRESS
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170489] N87-12997

RESONANCE
Resonant photon pumping mechanisms for a plasma X-ray laser
[AD-D012416] N87-12857

RESONATORS
Double-ended tuning fork quartz accelerometer
[DE86-012277] N87-12842

RESOURCES MANAGEMENT
Joint operating procedure for interrange scheduling
[AD-A169636] N87-12579

RESPIRATORY SYSTEM
Quantification of respiratory muscle performance
[AD-A169208] N87-13126

RESPONSES
Evaluating ecosystem response to toxicant stress: a state space approach
[DE86-011777] N87-13009

RETINA
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135

REYNOLDS NUMBER
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815

RIDING QUALITY
Development of a research method to determine the quality of task mastering by navigators in ship guidance N87-13154

RING LASERS
Optical rotation sensors
[AD-A169357] N87-12848
Comparison of ring laser and fiber-optic gyro technology N87-13276

RING STRUCTURES
Turbine air seal with full backside cooling
[AD-D012405] N87-12564

RIVER BASINS
Evaluation of remote sensing techniques to the detection of changes in a fluvial system due to human influence: The example of Canas River Basin (Sao Paulo State, Brazil)
[INPE-3970-PRE/963] N87-12980

ROBOTICS
On the dexterity of robotic manipulators N87-12867
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905
Review of robotic component insertion system for printed wiring assemblies
[DE86-013510] N87-12907
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203

ROBOTS
On the dexterity of robotic manipulators N87-12867
Multi use gripper for industrial robot
[AD-D012371] N87-12876
Integrating computer vision with a robot arm system
[AD-A171278] N87-12884
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905
Review of robotic component insertion system for printed wiring assemblies
[DE86-013510] N87-12907

ROCKET ENGINES
Advanced electric propulsion MPD (magnetoplasmadynamic)
[AD-A169792] N87-12610

ROCKET OXIDIZERS
Preparation of energetic compounds
[AD-A170022] N87-12704

ROCKS
Comparison of the 1984 and 1985 AIS data over the Singatse Range (Yerington), Nevada N87-12976

ROLLER BEARINGS
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915

ROLLING CONTACT LOADS
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12866

ROOTS OF EQUATIONS
Zero-crossings analysis
[AD-A169937] N87-13218

ROTARY GYROSCOPES
Optical rotation sensors
[AD-A169357] N87-12848

ROTARY WING AIRCRAFT
An experimental investigation of free-tip response to a jet
[NASA-TM-88250] N87-12539

ROTARY WINGS
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
The evaluation of a number of prototypes for the free-tip rotor constant-moment controller
[NASA-TM-88884] N87-12869

ROTATING BODIES
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933

ROTATING FLUIDS
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045

ROTATING SPHERES
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045

ROTATION
Comparison of ring laser and fiber-optic gyro technology N87-13276
Nonlinear ellipse rotation in a low-birefringence optical fiber N87-13282
The upper atmosphere of Venus: A tentative explanation of its rotation
[NASA-TM-88505] N87-13375

ROTOR AERODYNAMICS
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547

ROTOR BLADES
The evaluation of a number of prototypes for the free-tip rotor constant-moment controller
[NASA-TM-88884] N87-12869

ROTOR BLADES (TURBOMACHINERY)
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560

ROTOR BODY INTERACTIONS
Propeller/body interaction for thrust and drag
[ESDU-86017] N87-12537

ROTOR SYSTEMS RESEARCH AIRCRAFT
NASA rotor systems research aircraft: Fixed-wing configuration flight-test results
[NASA-TM-86789] N87-12557

ROTORS
An experimental investigation of free-tip response to a jet
[NASA-TM-88250] N87-12539
Cryogenic wound rotor for lightweight, high voltage generators
[AD-D012370] N87-12768

ROUGHNESS
Mechanical interactions of rough surfaces
[DE86-010686] N87-12901

RUNGE-KUTTA METHOD
Performance analysis of some numerical algorithms in the resolution of ODEs artificial satellite problems
[INPE-3996-PRE/995] N87-13206

RUPTURING
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940

S

S WAVES
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169289] N87-12931

SAFETY FACTORS
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
NASA's quality assurance program
[GPO-63-142] N87-12909

SAGE SATELLITE
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024

SAMPLES
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731

SAMPLING
Collection of ions in the stratosphere
[AD-A169905] N87-13032
Design and analysis of experiments and more realistic techniques for data analysis
[AD-A168921] N87-13228

SANDWICH STRUCTURES
Feasibility study of test problems for finite element/finite difference programs for structural dynamics
[AD-A169058] N87-12928
SATELLITE IMAGERY
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Estimation of precipitation from GOES IR imagery during FGGE: Application to diagnostic studies N87-13048
The use of satellite data in understanding and predicting convective and large-scale dynamical processes N87-13049
Variation objective analyses for cyclone studies N87-13050
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052
Application of satellite data to tropic/subtropic moisture coupling N87-13053
Remote observations of severe storms N87-13065
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13084
SATELLITE OBSERVATION
Study of satellite systems to monitor Earth's radiation budget
[CAP-420-071] N87-12994
SATELLITE ORBITS
Solar flux and geomagnetic activity prediction
[INPE-3884-PRE/934] N87-13377
SATELLITE ORIENTATION
Relative motion of the Sun on an artificial satellite
[INPE-3995-NTE/260] N87-12591
SATELLITE TRACKING
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575
SATELLITE-BORNE INSTRUMENTS
Millimeter wave components — spaceborne microwave radiometers
[FTL-118521] N87-12605
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
SATELLITE-BORNE PHOTOGRAPHY
The space station millimeter facility
[AD-A169983] N87-12604
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud property determination: Recommendations for digital data analysis
[AD-A169285] N87-12991
SCALING LAWS
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
SCATTERING
Severe storm detection with passive 37 GHz observations N87-13072
X-ray data booklet, revision
[DE86-012650] N87-13272
SCATTERING CROSS SECTIONS
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733
SCENE ANALYSIS
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3982-TDL/234] N87-12990
Application of a network associative scene analysis model
[INPE-3945-PRE/967] N87-13244
SCHEDULING
Joint operating procedure for interrange scheduling
[AD-A169636] N87-12579
Introduction to the theory of nested transactions
[AD-A171428] N87-13191
SCIENTIFIC SATELLITES
Solar flares and magnetospheric particles: Investigations based upon the ONR-60 experiments and ONR-604 experiments
[AD-A170620] N87-13381
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
SCIENTISTS
In retrospect: The impact of research production in the area of remote sensing
[INPE-3987-NTE/261] N87-12988
SCINTILLATION
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
SCINTILLATION COUNTERS
Observations on the Stanford 4800 KG gravity wave detector with a cosmic ray monitor N87-13399
SEA BREEZE
Airborne Doppler measurements of the central California extended sea breeze N87-13066
SEA WATER
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169289] N87-12931
SEALING
In-line determination of presence of liquid phase moisture in sealed IC packages
[AD-D012408] N87-12775
SEALS (STOPPERS)
Turbine air seal with full backside cooling
[AD-D012405] N87-12564
Sliding duct seal
[AD-D012369] N87-12875
Self-locking outer air seal with full backside cooling
[AD-D012406] N87-12880
Improved vane platform sealing and retention means
[AD-D012407] N87-12881
SEAMS (JOINTS)
Resistance seam welding
[DE86-013288] N87-12906
SEARCHING
Further results on interpolation searching of databases
[DE86-012822] N87-13356
SEASONS
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
SEATS
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126
Anthropometric handicaps in the construction of a helicopter cockpit — seats N87-13148
SECONDARY EMISSION
The secondary production of gamma rays in the Jovian magnetosphere N87-13391
SEDIMENTS
An analysis of the acoustic characteristics of ABSS (acoustic backscatter system) and its deployments
[AD-A170487] N87-13037
SEGMENTS
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229
SEISMIC WAVES
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
SEISMOLOGY
Lg wave excitation and propagation in presence of one-, two- and three-dimensional heterogeneities
[AD-A169004] N87-12724
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
SELENIUM
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702648] N87-13340
SEMICONDUCTOR DEVICES
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329
Picosecond nonlinear resonant interactions in semiconductors
[AD-A170613] N87-13330
SEMICONDUCTOR DIODES
Effects of optical feedback on the performance of high data rate single-mode fiber systems N87-13286
Quantum 1/F noise in solid state double devices, in particular Hg(1-x)CdxTe diodes
[AD-A171438] N87-13332
SEMICONDUCTOR LASERS
High power semiconductor laser sources
[AD-A168900] N87-12844
A study of methods of phase noise reduction of semiconductor lasers for sensor applications N87-13286
SEMICONDUCTORS (MATERIALS)
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010708] N87-13004
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
Rapid synthesis of indium phosphide
[AD-D012362] N87-13322
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326
Picosecond nonlinear resonant interactions in semiconductors
[AD-A169992] N87-13327
Kinetics and mechanisms on the molecular beam etching of semiconductors
[AD-A171360] N87-13331
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337
SENSITIVITY
Development of a sensitive superconducting gravity gradiometer for geological and navigational applications
[NASA-CR-4011] N87-13021
SENSORY STIMULATION
High-resolution analysis of eye movements
[AD-A170779] N87-13136
SEPARATED FLOW
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560
The calculation of separated flows of low-viscosity liquids using the Batchelor Model
[BR-100272] N87-12810
SEPARATORS
Importance of interfacial phenomena in separation science and technology
[DE86-011063] N87-12637
Zinc/air cell cathode
[AD-D012425] N87-12780
Zinc/nickel oxide battery membrane separator studies
[DE86-012824] N87-12793
SEQUENTIAL ANALYSIS
User's guide for NPSOL (version 4.0): A Fortran package for nonlinear programming
[AD-A169115] N87-13180
SERVICE LIFE
Reliability study of retention and memory gate integrity in a 1K MNOS RAM
[DE86-010483] N87-13175
SERVOMECHANISMS
Tracking servo compensator with rate aiding
[AD-D012388] N87-12735
SET THEORY
Inequalities for probability contents of convex sets via geometric average
[AD-A169938] N87-13219
A unified approach to constructing nonparametric rank tests
[AD-A169815] N87-13233
SHAPES
A finite element method for localized failure analysis
[AD-A169117] N87-12930
An intuitive approach to geometric continuity for parametric curves and surfaces
[AD-A169654] N87-13211

SHEAR FLOW
An analysis of shear band development incorporating heat conduction
[AD-A169972] N87-12926
SHEAR PROPERTIES
Dynamic analysis of a Timoshenko beam using a finite element approach
[EPM/RT-86-34] N87-12919
SHEAR STRESS
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831
SHIELDING
Simple defense conservative model for mass requirements of hypervelocity projectile impact shields for reentry vehicles
[DE86-012407] N87-12603
SHIFT REGISTERS
Interrupt control switch interface system
[AD-D012414] N87-12776
SHIPS
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Development of a research method to determine the quality of task mastering by navigators in ship guidance N87-13154
Nonlinear waves
[AD-A169934] N87-13207
SHOCK ABSORBERS
Shock absorbing device with integral pressure relief valve
[AD-D012379] N87-12677
Multiple rate shock isolator damping valve
[AD-D012394] N87-12679
SHOCK LOADS
Effects of variables upon pyrotechnically induced shock response spectra
[NASA-TP-2603] N87-12921
SHOCK SPECTRA
Effects of variables upon pyrotechnically induced shock response spectra
[NASA-TP-2603] N87-12921
SHOCK TESTS
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570
SHOCK TUNNELS
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
SHOCK WAVE PROPAGATION
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941
SHOCK WAVES
Effect of residual strain on twinning in shock-loaded copper
[DE86-007362] N87-12660
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
SHORT CRACKS
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169960] N87-12656
SHORT TAKEOFF AIRCRAFT
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-88785] N87-12558
SHROUDS
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
SIDELOBE REDUCTION
Temperature and frequency compensated array beam steering unit
[AD-D012365] N87-12767
SIDELOBES
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
SIEVES
Asymptotic theory for sieve estimators in semimartingale regression models
[AD-A169207] N87-13230
SIGNAL ANALYSIS
Zero-crossings analysis
[AD-A169937] N87-13218
SIGNAL DETECTION
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
Rapid acting electro-pneumatic anti-G suit control valve
[AD-D012377] N87-13170
SIGNAL DETECTORS
Three dimensional optical receiver having programmable gain sensor stages
[AD-D012369] N87-13267
SIGNAL FADING
Tone calibration technique: A digital signaling scheme for mobile applications
[NASA-CR-179915] N87-12719
SIGNAL PROCESSING
Reconstruction of undersampled periodic signals
[AD-A169697] N87-12722
Knowledge-based pitch detection
[AD-A169069] N87-12730
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
Progress in optical fiber gyroscopes using integrated optics N87-13283
Nonlinear planar guided wave interactions and devices N87-13290
Optoelectronic broadband switching for communications and signal processing N87-13294
SIGNAL REFLECTION
Foreground effects on troposcatter digital communication systems
[AD-A169360] N87-12734
Phase fluctuations of ionosphere radio signals N87-12955
SIGNAL TO NOISE RATIOS
Multichannel phase noise measurement system
[AD-D012372] N87-13253
SILANES
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542
SILICON
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860
Use of Wannier function in the calculations of band structure of covalent crystals
[DE86-702668] N87-13344
SILICON ALLOYS
Radiation-induced segregation to grain boundaries in a Ni-Si alloy
[DE86-010027] N87-12664
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12860
SILICON CARBIDES
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
SILICON DIOXIDE
Comparative thermal conductivity measurements at Sandia National Laboratories
[DE86-012926] N87-12647
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12935
Feasibility of making coherent fiber-optic arrays from fused silica
[AD-A170673] N87-13271
SILICON FILMS
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
New ultra low permittivity composites for use in ceramic packaging of GaAs integrated circuits
[AD-A168677] N87-12758
SILOXANES
Ionic conductivity in solid, crosslinked dimethylsiloxane-ethylene oxide copolymer networks containing sodium
[AD-A169036] N87-12683
Raman spectroscopy of carboranes and polycarboranesiloxanes
[DE86-009030] N87-12694
SILVER
Photoemission from oblate silver spheroids with polarized vacuum UV excitation
[DE86-006896] N87-13256
SIMULATION
Heat transfer characteristics of simulated microelectronic chips under normal and enhanced conditions
[PB86-224425] N87-12804
Comparison of Rayleigh-Taylor growth with 1.0 m and 0.25 m lasers
[DE86-012217] N87-12862
NOSL experiment support
[NASA-CR-179947] N87-13140
The optimal linear combination of control variates in the presence of bias
[AD-A169111] N87-13210
TSAR (Theater Simulation of Airbase Resources) database dictionary F-4E
[AD-A169575] N87-13352
SIMULATORS
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169684] N87-12711
Simulation of CIFF (Centralized IFF) remote control displays
[AD-A170387] N87-12742
Simulation of disturbances on the nuclear power plant simulator. The problem of the interpretation of operator actions and their cognitive backgrounds as a basis for design recommendations N87-13157
SINGLE CRYSTALS
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
Single crystal fibers N87-13298
Quartz growth on X-seeds
[AD-D012269] N87-13315
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320
SINGLE EVENT UPSETS
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314
SITE SELECTION
The siting, installation and operational suitability of the Automated Weather Observing System (AWOS) at heliports
[DOT/FAA/PM-86/30] N87-13099
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113
SITES
Site occupations in Li sub 2 ordered alloys by axial electron channeling microanalysis
[DE86-009421] N87-12669
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113
SKIN TEMPERATURE (BIOLOGY)
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131
SLEEP
Pharmacological resetting of the circadian sleep-wake cycle
[AD-A170604] N87-13137
SLEEP DEPRIVATION
Sleepability and wakeability following sleep deprivation
[AD-A169578] N87-13130
SLENDER BODIES
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
SLEWING
Tracking servo compensator with rate aiding
[AD-D012368] N87-12735
SLIDING
Study of high temperature failure mechanisms in ceramics
[AD-A170001] N87-12689
Sliding duct seal
[AD-D012369] N87-12675
SLIDING FRICTION
Mechanical interactions of rough surfaces
[DE86-010866] N87-12901
SLOTS
Super gripper variable vane arm
[AD-D012364] N87-12674
SMOKE
Advanced optical smoke meters for jet engine exhaust measurement
[NASA-CR-179459] N87-12829
SOCIAL FACTORS
Desertification: Global ecological problem N87-12950
SOCIOLOGY
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728

SODIUM SULFUR BATTERIES
Sodium-sulfur battery systems development
[DE86-011424] N87-12788
SOFTENING
An analysis of shear band development incorporating heat conduction
[AD-A169972] N87-12926
SOFTWARE ENGINEERING
Catalog of Resources for Education in Ada (Trade name) and Software Engineering (CREASE), version 4.0
[AD-A169892] N87-13186
Space plasma research
[NASA-CR-178965] N87-13307
SOFTWARE TOOLS
Tool to develop real time simulation systems
[INPE-3979-TDL/233] N87-13179
A software implementation of an interactive graphics system for three dimensional modeling and layout
[AD-A169264] N87-13183
SOIL MECHANICS
The application of boundary-element techniques for some soil-structure interaction problems
[AD-A169999] N87-12709
SOILS
Satellite passive microwave rain measurement techniques for land and ocean N87-13074
SOLAR ACTIVITY
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111
A study of the relationship between solar activity and interplanetary field variations
[AD-A169983] N87-13380
SOLAR ACTIVITY EFFECTS
Solar flux and geomagnetic activity prediction
[INPE-3984-PRE/934] N87-13377
SOLAR ARRAYS
Solar array flight dynamic experiment
[NASA-TP-2598] N87-12581
SOLAR ATMOSPHERE
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
SOLAR CELLS
Status and future of government-supported amorphous silicon research in the US
[DE86-010702] N87-12997
Stable, high-efficiency, CuInSe2-based polycrystalline thin-film tandem solar cells
[DE86-010705] N87-13003
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010708] N87-13004
Photovoltaic Concentrator Technology Project, Fourteenth Project Integration Meeting, June 10-11, 1986
[DE86-012051] N87-13006
SOLAR COLLECTORS
Apparatus for downward transport of heat
[DE86-013700] N87-12824
Integrated heat pipe-thermal storage design for a solar receiver
[DE86-011235] N87-12999
SOLAR CORONA
Magnetic field re-arrangement after prominence eruption
[DE86-012393] N87-13382
Large-scale electric fields resulting from magnetic reconnection in the corona
[DE86-012391] N87-13383
SOLAR COSMIC RAYS
Solar flares and magnetospheric particles: Investigations based upon the ONR-60 experiments and ONR-604 experiments
[AD-A170620] N87-13381
SOLAR DYNAMIC POWER SYSTEMS
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
SOLAR ENERGY CONVERSION
A study of energy conversion devices using photoactive organometallic electrocatalysts
[AD-A169096] N87-12996
Proof of feasibility of a novel inverter for photovoltaic power conditioning
[DE86-012729] N87-13001
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] Nb7-13005
SOLAR FLARES
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
Solar flares and magnetospheric particles: Investigations based upon the ONR-60 experiments and ONR-604 experiments
[AD-A170620] N87-13381
Magnetic field re-arrangement after prominence eruption
[DE86-012393] N87-13382
Large-scale electric fields resulting from magnetic reconnection in the corona
[DE86-012391] N87-13383
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13387
The gamma-ray spectrometer experiment on the solar maximum mission satellite
[NASA-CR-177877] N87-13394
Characterization of the gamma radiation in space and in the atmosphere
[DE86-013445] N87-13397
SOLAR GENERATORS
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] N87-13005
SOLAR HEATING
Studies of humid continental haze during SPACE
N87-13088
SOLAR MAGNETIC FIELD
Magnetic field re-arrangement after prominence eruption
[DE86-012393] N87-13382
SOLAR MAXIMUM MISSION
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
SOLAR PHYSICS
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
Equilibrium configuration of coronal loops
[DE86-702711] N87-13384
SOLAR RADIATION
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038
Model studies of solar spectral irradiance at the bottom and top of a cloudy atmosphere N87-13385
SOLAR RADIO BURSTS
Repetition rates of fast pulses in MM-waves/X-ray solar bursts
[INPE-3974-PRE/986] N87-13378
SOLAR SYSTEM
The space station millimeter facility
[AD-A169983] N87-12604
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances
N87-13392
SOLAR TERRESTRIAL INTERACTIONS
Solar control of geophysical phenomena N87-12953
SOLAR THERMAL ELECTRIC POWER PLANTS
Proceedings of the Solar Thermal Technology Conference
[DE86-011703] N87-13002
SOLAR WIND
A study of the relationship between solar activity and interplanetary field variations
[AD-A169983] N87-13380
Characterization of the gamma radiation in space and in the atmosphere
[DE86-013445] N87-13397
SOLAR X-RAYS
Repetition rates of fast pulses in MM-waves/X-ray solar bursts
[INPE-3974-PRE/986] N87-13378
SOLENOIDS
Polarized H(-) source development at BNL
[DE86-012704] N87-13257
SOLID PROPELLANT ROCKET ENGINES
Shifts in shuttle SRM performance because of ammonium perchlorate crystal shape on missions 51-I/J and 61-A/B
[NASA-TM-86561] N87-12607
SOLID ROCKET PROPELLANTS
Pulsed-laser, high speed photography of rocket propellant surface deflagration
[AD-A169308] N87-12703
SOLID STATE
Direct writing of microstructures for solid-state electronics
[AD-A170837] N87-12783
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010708] N87-13004
SOLIDIFICATION
Cellular solidification of transparent monotectics
[NASA-CR-177039] N87-12926
APFIM study of antiphase and grain boundaries in Ni Al
[DE86-008494] N87-12662
Kinetic and thermodynamic studies of pulsed laser irradiation
[DE86-012175] N87-12980
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
SOLIDS
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941
SOLITARY WAVES
Evaluating nonlinear effects in propagation of acoustic pulse in atmospheric surface layer in inversions
N87-12951
SOLUBILITY
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
SOLUTES
Generalization of one-dimensional solute transport: A stochastic-convective flow conceptualization
[DE86-011117] N87-12620
SOUND TRANSMISSION
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 6: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
SOUND WAVES
Liquid metal thermoacoustic engine
[DE86-011264] N87-12902
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169289] N87-12931
Evaluating nonlinear effects in propagation of acoustic pulse in atmospheric surface layer in inversions
N87-12951
SOUTH CAROLINA
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13109
SOUTHERN HEMISPHERE
A survey of hard-X-rays at balloon altitudes of the Earth's atmosphere
[INPE-3954-PRE/972] N87-13386
SPACE CHARGE
Flight model discharge system
[AD-A169423] N87-12571
Theory and simulation of high-brightness electron beam production from laser-irradiated photocathodes in the presence of dc and RF electric fields
[DE86-012384] N87-12984
Two-dimensional dynamics of the plasma Wakefield accelerator
[DE86-012382] N87-13312
SPACE COMMERCIALIZATION
National Commission on Space report
[GPO-83-143] N87-12574
SPACE EXPLORATION
Upper stage selected for planetary missions
[NASA-NEWS-RELEASE-86-161] N87-12593
SPACE FLIGHT
Space flight operations communications phraseology and techniques
[NASA-TM-86562] N87-12721
SPACE HEATING (BUILDINGS)
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
SPACE PLASMAS
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
Space plasma research
[NASA-CR-178965] N87-13307
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
SPACE PROGRAMS
National Commission on Space report
[GPO-83-143] N87-12574
Space nuclear safety program
[DE86-012767] N87-13261

SPACE SHUTTLE MAIN ENGINE
SSME main injector 4000 Hertz phenomenon
[NASA-CR-178934] N87-12608
SPACE SHUTTLE PAYLOADS
Solar array flight dynamic experiment
[NASA-TP-2598] N87-12581
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
Upper stage selected for planetary missions
[NASA-NEWS-RELEASE-86-161] N87-12593
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
NOSL experiment support
[NASA-CR-178947] N87-13140
SPACE SHUTTLES
Evaluation of a nonlinear parameter extraction mathematical model including the term C(subm(sub delta e squared))
[NASA-TM-87731] N87-12566
Lunar laboratory
[NASA-TM-89209] N87-12580
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-12602
NASA's quality assurance program
[GPO-63-142] N87-12909
The meteorological interactive data display system N87-13091
Ionization phenomena about the space shuttle
[AD-A170542] N87-13310
SPACE STATIONS
Lunar laboratory
[NASA-TM-89209] N87-12580
Viewport concept for space station modules
[NASA-TM-86559] N87-12592
An approach to design knowledge capture for the space station
[NASA-TM-89272] N87-12597
The ecology of microorganisms in a small closed system: Potential benefits and problems for space station
[NASA-TM-86563] N87-13166
SPACE TECHNOLOGY EXPERIMENTS
Metallurgical characterization of the interfaces and the damping mechanisms in metal matrix composites
[AD-A169186] N87-12616
SPACE TRANSPORTATION SYSTEM
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
SPACE WEAPONS
Development of regenerable energy storage for space multimegawatt applications
[DE86-011070] N87-12996
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A168946] N87-13245
SPACE-TIME FUNCTIONS
Some investigations into variable meshes for numerical solution of partial differential equations
[AD-A168977] N87-13208
SPACEBORNE EXPERIMENTS
Theoretical and experimental studies in support of the geophysical fluid flow experiment N87-13045
Space shuttle/mesoscale lightning experiment N87-13060
SPACEBORNE PHOTOGRAPHY
Photographic sensors: Basic concepts
[INPE-3990-MD/031] N87-12966
SPACECRAFT CHARGING
Density and electrostatic potential distribution around a cylindrical satellite
[INPE-3953-NTE/258] N87-12595
Space plasma research
[NASA-CR-178985] N87-13307
SPACECRAFT COMMUNICATION
Space flight operations communications phraseology and techniques
[NASA-TM-86562] N87-12721
SPACECRAFT COMPONENTS
Investigation of the Challenger accident, volume 2
[GPO-64-548] N87-12586
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12596
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
SPACECRAFT CONSTRUCTION MATERIALS
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
SPACECRAFT DEFENSE
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A168946] N87-13245
SPACECRAFT DESIGN
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12596
SPACECRAFT ENVIRONMENTS
The ecology of microorganisms in a small closed system: Potential benefits and problems for space station
[NASA-TM-86563] N87-13166
SPACECRAFT LAUNCHING
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585
Upper stage selected for planetary missions
[NASA-NEWS-RELEASE-86-161] N87-12593
SPACECRAFT MODELS
Flight model discharge system
[AD-A169423] N87-12571
SPACECRAFT MODULES
Viewport concept for space station modules
[NASA-TM-86559] N87-12592
SPACECRAFT POWER SUPPLIES
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-86884] N87-12606
Development of regenerable energy storage for space multimegawatt applications
[DE86-011070] N87-12996
Space nuclear safety program
[DE86-012767] N87-13261
SPACECRAFT STABILITY
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
SPACECRAFT STRUCTURES
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-12602
SPARK GAPS
Nanosecond spark gap switching measurements
[DE86-012279] N87-12790
SPATIAL DISTRIBUTION
Periodic heat transfer through an inhomogeneous medium
[DE86-702968] N87-12825
SPATIAL RESOLUTION
Effects of reduced spatial resolution on the NEXRAD storm sequence algorithms
[PB86-221726] N87-13117
SPECIFICATIONS
Gas tungsten arc welding of aluminum alloys 6XXX. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012548] N87-12893
Gas tungsten arc welding of carbon steel to nickel-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012549] N87-12894
Gas tungsten arc welding of chromium-nickel steel to nickel-molybdenum-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012550] N87-12895
SPECIMENS
Localized ion milling of metallic and ceramic TEM specimens
[DE86-009536] N87-12900
SPECTRAL BANDS
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
SPECTRAL RESOLUTION
Comparison of various techniques for calibration of AIS data N87-12970
Airborne spectroradiometry: The application of AIS data to detecting subtle mineral absorption features N87-12972
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution remote sensing N87-12973
SPECTRAL SIGNATURES
Patterns of vegetation in the Owens Valley, California N87-12956
SPECTRAL THEORY
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038
SPECTROMETERS
Slitless, intensified readout, gated spectrometer: Wavelength and efficiency calibration, time response characterization
[DE86-012349] N87-12839
Time Projection Compton Spectrometer (TPCS)
[DE86-012950] N87-12840
FET charge sensor and voltage probe
[NASA-CASE-NPO-16045-1] N87-13313
SPECTROSCOPY
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12640
Raman spectroscopic investigation of molecular hydrogen
[DE86-012836] N87-12646
SPECTRUM ANALYSIS
Fiber-optic magnetic gradiometer with variable magnetic biasing fields
[AD-D012423] N87-12836
Acoustooptic spectrum analyzer using a planar Bragg-cell N87-13295
SPEECH
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746
SPEECH RECOGNITION
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729
Knowledge-based pitch detection
[AD-A169069] N87-12730
SPHERICAL COORDINATES
Relative motion of the Sun on an artificial satellite
[INPE-3985-NTE/260] N87-12591
SPIN DYNAMICS
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12584
Magnetospheric plasma studies using data from the dynamics explorer high and low altitude plasma instruments
[AD-A169010] N87-13027
SPIN REDUCTION
Analysis of the nonlinear stability of circular Couette flow
[AD-A168951] N87-12811
SPIN STABILIZATION
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12584
Analysis of the nonlinear stability of circular Couette flow
[AD-A168951] N87-12811
Low Q spin-up from rest
[AD-A169106] N87-12813
SPIN TESTS
An experimental investigation of free-tip response to a jet
[NASA-TM-88250] N87-12539
SPIN-SPIN COUPLING
Structural features at the Si-SiO2 interface
[DE86-012947] N87-13339
SPINE
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
Investigation of vibrations of the spinal column of healthy subjects N87-13155
SPLINE FUNCTIONS
An intuitive approach to geometric continuity for parametric curves and surfaces
[AD-A169654] N87-13211
SPRAY NOZZLES
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585
SPUTTERING
Plasma assisted surface coating/modification processes: An emerging technology
[NASA-TM-88885] N87-12708
STABILITY
Stability of multilayers at high temperatures
[DE86-010526] N87-12623
Transition metal. 2: Complexes of dithiacycloph anes
[AD-A169107] N87-12651
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-008537] N87-12667
STABILITY TESTS
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89060] N87-12538
STABILIZATION
Stabilizing effects of finite-amplitude RF waves on the interchange instability
[DE86-013042] N87-12751

Stabilization of voltage-controlled oscillators through resonant cavities
[INPE-3941-RPE/512] N87-12757
STAGNATION FLOW
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560
STAINLESS STEELS
Comparative thermal conductivity measurements at Sandia National Laboratories
[DE86-012926] N87-12647
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-008537] N87-12667
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12892
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12936
STANDARDS
Department of Defense gateway architecture and functional requirements
[AD-A169086] N87-13200
STAR FORMATION
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances N87-13392
STARTERS
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
STATIC FIRING
SSME main injector 4000 Hertz phenomenon
[NASA-CR-178934] N87-12608
STATIC PRESSURE
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
STATIC STABILITY
A procedure for attitude determination of artificial satellites utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
STATICS
A finite element method for localized failure analysis
[AD-A169117] N87-12930
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933
STATISTICAL ANALYSIS
Determination of the coefficient of thermal expansion of JP-4 fuels
[AD-A171495] N87-12705
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940
Statistical analysis and use of VAS radiance data N87-13086
Design and analysis of experiments and more realistic techniques for data analysis
[AD-A169921] N87-13228
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242
Continuum radiation from active galactic nuclei: A statistical study
[NASA-CR-179925] N87-13368
STATISTICAL DISTRIBUTIONS
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733
Extreme values of birth and death processes and queues
[AD-A169932] N87-13235
Two issues concerning the analysis of grouped data
[DE86-008401] N87-13242
STATISTICAL TESTS
A unified approach to constructing nonparametric rank tests
[AD-A169816] N87-13233
STATISTICAL WEATHER FORECASTING
Application of satellite data to tropic/subtropic moisture coupling N87-13053
STEADY FLOW
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87875] N87-12806
STEADY STATE
The optimal linear combination of control variates in the presence of bias
[AD-A169111] N87-13210
Equilibrium configuration of coronal loops
[DE86-702711] N87-13384
STEAM FLOW
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805
STEEL STRUCTURES
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914
STEELS
Bainite in chromium-molybdenum steels
[DE86-011781] N87-12886
Welding research in Scandinavia: An assessment
[AD-A169036] N87-12871
Heat measurements in inertia welding of aluminum to steel
[DE86-012483] N87-12885
Buffered explosions in steel pressure vessels
[DE86-008763] N87-12898
Effects of inertia weld parameters and contamination on weld flash shape and on joint strength: An improved study
[DE86-013074] N87-12904
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943
STEERABLE ANTENNAS
Temperature and frequency compensated array beam steering unit
[AD-D012365] N87-12787
STEERING
Tracking servo compensator with rate aiding
[AD-D012388] N87-12735
A brief review of adaptive null steering techniques
[AD-A169548] N87-12736
Beam steering mirror construction
[AD-D012399] N87-13268
STELLAR ATMOSPHERES
Classification of N-type carbon stars
[AD-A171399] N87-13369
STELLAR CORONAS
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
STELLAR EVOLUTION
Classification of N-type carbon stars
[AD-A171399] N87-13369
STELLAR MASS ACCRETION
Neutron and antineutron production in accretion onto compact objects
[NASA-TM-89264] N87-13395
STELLAR MODELS
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
STELLAR OCCULTATION
Classification of N-type carbon stars
[AD-A171399] N87-13369
STELLAR PHYSICS
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
STELLAR RADIATION
Investigations of long-period DQ Herculis star N87-13364
STELLAR ROTATION
Investigations of long-period DQ Herculis star N87-13364
STELLAR SPECTRA
Plane-parallel and bow shock models of Herbig-Haro objects N87-13374
STIFFENING
Improved anti-G suit
[AD-D012378] N87-13171
STIRLING ENGINES
Linear harmonic analysis of free-piston Stirling engines
[DE86-012451] N87-12903
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-88891] N87-13359
STOCHASTIC PROCESSES
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
Generalization of one-dimensional solute transport: A stochastic-convective flow conceptualization
[DE86-011117] N87-12820
Validity of Edgeworth expansions of minimum contrast estimators for Gaussian ARMA processes
[AD-A169931] N87-13217
Semigroups and Poisson-approximation
[AD-A170944] N87-13224
Heredity of stationary and reversible stochastic processes
[AD-A169926] N87-13234
STOICHIOMETRY
Low temperature formation of mullite
[AD-D012404] N87-12687
STOPPING
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12888
STOPPING POWER
Influence of a strong laser field on the stopping power for charged test particles in fusion plasmas
[INPE-3977-PRE/988] N87-12843
STORAGE
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
STORAGE RINGS (PARTICLE ACCELERATORS)
High-gain free electron lasers as generators of short wavelength coherent radiation
[DE86-012500] N87-12865
STORM ENHANCEMENT
Third International Symposium on Tropical Meteorology N87-12948
STORMS
Mesoscale ageostrophic circulations associated with baroclinic jet streaks N87-13070
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
LAMPS software and mesoscale prediction studies N87-13076
Effects of reduced spatial resolution on the NEXRAD storm sequence algorithms
[PB86-221726] N87-13117
STORMS (METEOROLOGY)
Statistical analysis and use of VAS radiance data N87-13086
Studies of humid continental haze during SPACE N87-13088
A design study for a three-dimensional display computer terminal for meteorological information N87-13092
STRAIN ENERGY METHODS
Dynamic analysis of a Timoshenko beam using a finite element approach
[CPM/RT-86-34] N87-12919
Computation of the amplitude of stress singular terms for cracks and reentrant corners
[AD-A169796] N87-12936
STRAIN HARDENING
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
STRAIN MEASUREMENT
A new and efficient formulation for finite element analysis of thin shell structures undergoing small and large deflection N87-12913
STRAIN RATE
Effect of strain and strain rate on residual microstructures in copper
[DE86-007381] N87-12659
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
A finite element method for localized failure analysis
[AD-A169117] N87-12930
STRAPDOWN INERTIAL GUIDANCE
Fibre optic gyroscopes in inertial navigation N87-13275
STRAPS
Improved anti-G suit
[AD-D012378] N87-13171
STRATEGY
Report of the Ad-Hoc Commission on remote sensing
[INPE-3981-NTE/259] N87-12983
STRATOSPHERE
Possible military applications of stratospheric airship discussed N87-12716
Description of data on the Nimbus 7 LIMS map archive tape: Ozone and nitric acid
[NASA-TP-2625] N87-13022
SAGE 2 satellite data set validation
[NASA-CR-178189] N87-13024
Collection of ions in the stratosphere
[AD-A169905] N87-13032
Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011008] N87-13040

Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111

STRESS (PHYSIOLOGY)
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746

STRESS (PSYCHOLOGY)
Determination of the load and stress of a cockpit crew during aircraft piloting using task networks and the simulation language SAINT N87-13150
Inquiry techniques for the evaluation of man machine systems N87-13162

STRESS ANALYSIS
Nuclear reaction analysis of hydrogen in metals
[AD-A169032] N87-12649
Factors influencing elastic stresses in double cantilever beam specimens
[NASA-TM-89033] N87-12922

STRESS CORROSION CRACKING
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12676

STRESS INTENSITY FACTORS
Crack-tip chemistry and fracture mechanics-based model of the crack growth rate/stress intensity relationship for Ni + P
[DE86-011106] N87-12676
The control of polymer mechanical behavior by surface modification
[AD-A169252] N87-12686
Analysis of mixed-mode crack propagation using the boundary integral method
[NASA-CR-179518] N87-12915

STRESS MEASUREMENT
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12935

STRESS PROPAGATION
Stress assisted diffusion in elastic and viscoelastic materials
[AD-A169296] N87-12932

STRESSES
Stress effects on moisture transport in an epoxy resin and its composite
[AD-A169306] N87-12617
Influence of experimental scatter on the analysis and extrapolation of stress-rupture data
[DE86-009510] N87-12940
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943
Surface green function matching for a three-dimensional non-local continuum
[DE86-702647] N87-13341

STRUCTURAL ANALYSIS
Constructive and operational characteristics of a synchronous induction motor
[INPE-3976-RPE/517] N87-12755
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918
MAGNA (Materially And Geometrically Nonlinear Analysis). Addendum 1, parts 1-4
[AD-A169383] N87-12933
An expert-system-like feedback approach in the hp-version of the finite element method
[AD-A169855] N87-13214
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13338

STRUCTURAL DESIGN
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
Literature review on the design of composite mechanically fastened joints
[AD-A169112] N87-12872
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-88891] N87-13359

STRUCTURAL DESIGN CRITERIA
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
Modeling the fundamental characteristics and processes of the spacecraft functioning
[NASA-TM-87999] N87-12598
Proceedings of the Solar Thermal Technology Conference
[DE86-011703] N87-13002

STRUCTURAL ENGINEERING
The application of boundary-element techniques for some soil-structure interaction problems
[AD-A168399] N87-12709

STRUCTURAL MEMBERS
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
Multiple rate shock isolator damping valve
[AD-D012394] N87-12679

STRUCTURAL PROPERTIES (GEOLOGY)
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A169971] N87-13026

STRUCTURAL RELIABILITY
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765

STRUTS
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543

SUBHARMONIC GENERATORS
Millimeter wave components — spaceborne microwave radiometers
[FTL-118521] N87-12605

SUBMERGING
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131

SUBMILLIMETER WAVES
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731

SUBSTRATES
SAW transduction in electrostrictive substrates
[DE86-011651] N87-12794

SUN
Relative motion of the Sun on an artificial satellite
[INPE-3985-NTE/260] N87-12591
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances N87-13392

SUNLIGHT
Solid-state electrochromic switchable window glazings
[DE86-004455] N87-12700

SUNRISE
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036

SUNSET
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036

SUPERCOMPUTERS
Solving scientific problems on hypercube parallel computers
[DE86-012622] N87-13199

SUPERCONDUCTORS
Development of a sensitive superconducting gravity gradiometer for geological and navigational applications
[NASA-CR-4011] N87-13021
Tunneling effect in superconductors with magnetic impurities
[DE86-702723] N87-13345
Flux spiral instability in a transport current carrying type 2 superconductor
[DE86-702724] N87-13346

SUPERCRITICAL FLUIDS
Electrochemistry in near-critical and supercritical fluids. 3: Studies of Br(-), I(-) and hydroquinone in aqueous solutions
[AD-A169138] N87-12633
Transport and relaxation processes in supercritical fluids
[DE86-007847] N87-12638

SUPERGRAVITY
Superconformal tensor calculus and matter couplings in six dimensions
[DE86-702617] N87-13349
Supergravity
[DE86-701481] N87-13370

SUPERHIGH FREQUENCIES
Microwave loss properties of hexagonal ferrites for millimeter wave applications
[AD-A169982] N87-13318

SUPERLATTICES
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612
Propagation of electromagnetic waves in superlattices
[DE86-702660] N87-12753
Moessbauer-Borrmann superradiance
[DE86-012373] N87-12866
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337

SUPERNOVA REMNANTS
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
X-ray emission from supernova remnants N87-13398

SUPERSONIC COMBUSTION RAMJET ENGINES
Further shock tunnel studies of scramjet phenomena
[NASA-CR-179937] N87-12542

SUPERSONIC FLOW
An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow (axial force)
[BR-100271] N87-12540

SUPERSYMMETRY
Superconformal tensor calculus and matter couplings in six dimensions
[DE86-702617] N87-13349
Supergravity
[DE86-701481] N87-13370

SURFACE ACOUSTIC WAVE DEVICES
SAW transduction in electrostrictive substrates
[DE86-011651] N87-12794

SURFACE CRACKS
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943

SURFACE FINISHING
Plasma assisted surface coating/modification processes: An emerging technology
[NASA-TM-88885] N87-12706

SURFACE LAYERS
Available potential energy in upper layer of world ocean N87-12949

SURFACE NAVIGATION
Medium-frequency data link for differential NAVSTAR/GPS broadcasts
[AD-A169788] N87-12554

SURFACE PROPERTIES
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596
Electron spectroscopy in fundamental catalytic studies
[DE86-008781] N87-12639
Digest: Proceedings of the International Conference on Optical and Millimeter Wave Propagation and Scattering in the Atmosphere
[AD-A170393] N87-12743
A constitutive law for finite element contact problems with unclassical friction
[NASA-TM-88838] N87-12924
Analysis of AIS radiometry with emphasis on determination of atmospheric properties and surface reflectance N87-12971
Near-infrared detection of ammonium minerals at Ivanhoe Hot Springs, Nevada N87-12981
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13264
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13338

SURFACE REACTIONS
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169082] N87-12632
On the interplay between chemical reactions and phase transitions for molecules adsorbed on solid surfaces
[AD-A169818] N87-12636
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Proceedings of the Topical Meeting on the Microphysics of Surfaces, Beams and Adsorbates held in Santa Fe, New Mexico on 4-6 February 1985
[AD-A170797] N87-13329

SURFACE ROUGHNESS
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12817

SURFACE WAVES
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120

SURFACES
An intuitive approach to geometric continuity for parametric curves and surfaces
[AD-A169654] N87-13211
SURFACTANTS
Investigation of deviations from ideality in the two liquid phase region of systems of medium molecular weight hydrocarbon mixtures and water
[AD-A169752] N87-12635
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12923
SURGES
Fluid transients in pipes. Estimation of maximum pressures and forces in steam lines
[ESDU-86015] N87-12805
SURVEILLANCE
Very low bandwidth, unattended imager for surveillance applications
[DE86-013570] N87-12799
SURVEYS
Report on the activities of the irrigated crop survey in Sao Paulo State from remote sensing products, phase 2
[INPE-3950-RPE/513] N87-12969
Comparison of tropical forest surveys
[DE86-011699] N87-12993
SURVIVAL
Duel between an ASAT (anti-satellite) with multiple kill vehicles and a space-based weapons platform with kinetic energy weapons
[AD-A169948] N87-13245
SWEPTBACK WINGS
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570
SWITCHES
Modeling of high-explosive driven plasma compression opening switches
[DE86-012421] N87-12795
SWITCHING
Nanosecond spark gap switching measurements
[DE86-012279] N87-12790
SWITCHING CIRCUITS
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
Optoelectronic broadband switching for communications and signal processing N87-13294
SYNCHRONOUS MOTORS
Constructive and operational characteristics of a synchronous induction motor
[INPE-3976-RPE/517] N87-12755
SYNCHRONOUS SATELLITES
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575
Studies of lightning data in conjunction with geostationary satellite data N87-13058
SYNCHROTRON RADIATION
X-ray fluorescence with synchrotron radiation
[DE86-010543] N87-13124
X-ray data booklet, revision
[DE86-012650] N87-13272
SYNOPTIC METEOROLOGY
Application of satellite data to tropic/subtropic moisture coupling N87-13053
Mesoscale-cloud scale simulation of convective response N87-13077
A summary of research on mesoscale energetics of severe storm environments N87-13082
SYNTHESIS (CHEMISTRY)
Investigation of the effects of short chain processing additives on polymers
[NASA-TM-89023] N87-12614
Transition metal. 2: Complexes of dithiocyclopentadienes
[AD-A169107] N87-12651
Electrokinetic properties of polymer colloids
[NASA-CR-178938] N87-12681
Low temperature formation of mullite
[AD-D012404] N87-12687
Synthesis of conjugated polymers with alternating aromatic and quinonoid sequences via elimination on precursors
[AD-A171331] N87-12693
Methods for the syntheses of mono-, di-, tri- and tetranitro derivatives of diphenylamine
[WSRL-0436-TR] N87-12702
Rapid synthesis of indium phosphide
[AD-D012362] N87-13322
SYNTHETIC APERTURE RADAR
A new method of synthetic aperture radar image reconstruction using modified convolution back-projection algorithm
[AD-A170652] N87-12747
ERS-1 SAR data processing
[NASA-CR-179913] N87-12965
Lightwave technology in future radar equipment designs N87-13304
SYNTHETIC ARRAYS
Lightwave technology in future radar equipment designs N87-13304
SYNTHETIC FUELS
Production of a clean carbon fuel derived from coal for use in stationary and mobile heat engines
[DE86-011203] N87-12706
SYSTEM FAILURES
An application of a LISP based expert system for failure diagnosis of the CH-47 flight control hydraulic system
[AD-A169970] N87-12567
SYSTEM IDENTIFICATION
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
SYSTEMS ANALYSIS
Procedure for one axis satellites attitude control with magnetic actuation
[INPE-3695-PRE/937] N87-12590
An approach to design knowledge capture for the space station
[NASA-TM-89272] N87-12597
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
Constructive and operational characteristics of a synchronous induction motor
[INPE-3976-RPE/517] N87-12755
System-ergonomic workload analysis for highly automated process control tasks N87-13152
SYSTEMS ENGINEERING
Sodium-sulfur battery systems development
[DE86-011424] N87-12786
Tool to develop real time simulation systems
[INPE-3979-TDL/233] N87-13179
SYSTEMS INTEGRATION
Problems in integrated digital networks
[AD-A170442] N87-12744
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203
SYSTEMS MANAGEMENT
Federal information systems management: Problems, solutions and more problems
[AD-A171366] N87-13353
SYSTEMS STABILITY
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611

T

TAIL ASSEMBLIES
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543
TARGET ACQUISITION
The eye-mark investigation as an anthropotechnical method to study man machine systems N87-13160
TARGET RECOGNITION
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
TASKS
The measurement of the psychological workload during task-related activities, including car driving, by competing time interval estimation N87-13153
Development of a research method to determine the quality of task mastering by navigators in ship guidance N87-13154
TAXONOMY
Application of the task taxonomy method to the simulation of human service reliability in the manual control of aircraft
[MBB/LKE-301/S/PUB/218] N87-13151
TAYLOR INSTABILITY
Analysis of the nonlinear stability of circular Couette flow
[AD-A169951] N87-12811
TECHNOLOGICAL FORECASTING
The portfolio model of technological development in the aircraft industry
[AD-A170832] N87-12534
TECHNOLOGIES
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
TECHNOLOGY ASSESSMENT
The portfolio model of technological development in the aircraft industry
[AD-A170832] N87-12534
Advanced solar dynamic space power systems perspectives, requirements and technology needs
[NASA-TM-88884] N87-12606
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12989
TECHNOLOGY TRANSFER
The uncounted benefits: Federal efforts in domestic technology transfer
[NASA-CR-177044] N87-13358
An examination of technology transfer as a tool for management
[AD-A169184] N87-13360
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13361
TECHNOLOGY UTILIZATION
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13361
TELECOMMUNICATION
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728
TELEMETRY
Instrumentation research and support services
[AD-A169278] N87-13029
TELEVISION SYSTEMS
Integrating computer vision with a robot arm system
[AD-A171278] N87-12884
TEMPERATURE COMPENSATION
Temperature compensation in the 2:17 type magnet s
[AD-A169487] N87-13250
TEMPERATURE CONTROL
Shower and high-pressure oil temperature control
[DE86-009398] N87-12889
TEMPERATURE DEPENDENCE
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
Data requirements to model creep in 9Cr-1Mo-V steel
[DE86-011754] N87-12944
TEMPERATURE EFFECTS
Vapour pressures and critical points of liquids. Part 2C: Alkadienes and alkynes
[ESDU-86001-PT-2C] N87-12624
Optical spectroscopy of dynamically compressed liquids
[AD-A169013] N87-12629
Fracture toughness of CIP-HIP beryllium at elevated temperatures
[AD-A169769] N87-12654
Temperature and frequency compensated array beam steering unit
[AD-D012365] N87-12767
TEMPERATURE GRADIENTS
Process for carbon-carbon composite fabrication
[AD-D012413] N87-12621
TEMPERATURE MEASUREMENT
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12894
Coordinated study of the behavior of the middle atmosphere in winter: Monthly mean comparisons of satellite and radiosonde data and derived quantities N87-13019
TEMPERATURE PROFILES
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905
TEMPERATURE SENSORS
Fiber optic device for temperature remote sensing N87-13290
TENSOR ANALYSIS
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216
TENSORS
Solving systems of nonlinear equations by tensor methods
[AD-A169927] N87-13216
Induced quantum torsion
[DE86-702618] N87-13348
Superconformal tensor calculus and matter couplings in six dimensions
[DE86-702617] N87-13349
TERMINAL GUIDANCE
Guidance law simulation studies for complex approaches using the Microwave Landing System (MLS)
[NASA-CR-178182] N87-12552
TERMINOLOGY
Space flight operations communications phraseology and techniques
[NASA-TM-86562] N87-12721

TERRAIN
Surface correlation relationships in rough surface scattering
[AD-A169327] N87-12733
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
TERRESTRIAL RADIATION
Stratospheric balloon experiments
[INPE-3995-RPE/519] N87-13020
The use of satellite data in understanding and predicting convective and large-scale dynamical processes
N87-13049
TEST FACILITIES
Joint operating procedure for interrange scheduling
[AD-A169636] N87-12579
TETHERED SATELLITES
High voltage characteristics of the electrodynamic tether and the generation of power and propulsion
[NASA-CR-178949] N87-12609
TEXAS
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
THEMATIC MAPPING
The Multispectral Atmospheric Mapping Sensor (MAMS): Instrument description, calibration and data quality
[NASA-TM-86565] N87-12628
Soil types and forest canopy structures in southern Missouri: A first look with AIS data N87-12963
Generation of images with recorded auxiliary data for the LANDSAT Thematic Mapper (TM) imagery
[INPE-3962-TDL/234] N87-12990
THEORETICAL PHYSICS
Theoretical high energy physics
[DE86-012669] N87-13259
THERMAL ABSORPTION
Phase change thermal energy storage methods for combat vehicles, phase 1
[AD-A170492] N87-12713
THERMAL ANALYSIS
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765
THERMAL CONDUCTIVITY
Comparative thermal conductivity measurements at Sandia National Laboratories
[DE86-012926] N87-12647
Periodic heat transfer through an inhomogeneous medium
[DE86-702968] N87-12825
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
THERMAL EXPANSION
New materials for spacecraft stability and damping: A feasibility study
[AD-A169826] N87-12601
Determination of the coefficient of thermal expansion of JP-4 fuels
[AD-A171495] N87-12705
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170493] N87-12937
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326
THERMAL INSTABILITY
Cryogenic wound rotor for lightweight, high voltage generators
[AD-D012370] N87-12766
THERMAL STABILITY
Temperature compensation in the 2:17 type magnet s
[AD-A169487] N87-13250
THERMAL STRESSES
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12935
THERMOCHEMISTRY
Plasma joining of metal matrix composites
[AD-A169056] N87-12615
New results on low temperature thermal oxidation of silicon
[AD-A169603] N87-12634
Plasma assisted surface coating/modification processes: An emerging technology
[NASA-TM-88865] N87-12708
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12935
Experimental investigation of thermochemical transport for solar applications using sulfur trioxide
[DE86-011762] N87-13005
THERMOCLINES
The Gulf Stream dynamics experiment. Inverted echo sounder data report for the June 1984 to May 1985 deployment period
[AD-A170758] N87-13121
THERMODYNAMIC PROPERTIES
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Comparison of methods for the calculation of thermal contact resistance of the first Brazilian satellite
[INPE-3864-TDL/217] N87-12596
Relationship of in-cylinder gaseous and particulate concentration to radiative heat transfer in direct injection-type diesel combustion
[AD-A169979] N87-12628
The 1984 IR and D (Independent Research and Development) advanced packaging study
[AD-A169388] N87-12765
Progress of Stirling cycle analysis and loss mechanism characterization
[NASA-TM-88891] N87-13359
THERMODYNAMICS
Phase equilibrium predictions for polar and hydrogen bonding mixtures
[DE86-011612] N87-12642
The influence of welding flux on the pyrometallurgical, physical and mechanical behavior of weld metal
[AD-A169067] N87-12650
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12685
Shock-induced solid state chemistry: Theoretical background
[DE86-012741] N87-12941
THERMOELECTRIC GENERATORS
Space nuclear safety program
[DE86-012767] N87-13261
THERMOPHYSICAL PROPERTIES
Thermophysical properties measurements of gallium arsenide and cadmium telluride
[AD-A169901] N87-13326
THERMOPLASTICITY
An analysis of shear band development incorporating heat conduction
[AD-A169972] N87 12926
THERMOREGULATION
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131
THICK PLATES
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169289] N87-12931
THIN FILMS
Intrinsic SiO2 film stress measurements on thermally oxidized Si
[AD-A169602] N87-12935
Stable, high-efficiency, CuInSe2-based polycrystalline thin-film tandem solar cells
[DE86-010705] N87-13003
Solid State Photovoltaic Research Branch annual report, FY 1985
[DE86-010706] N87-13004
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-13328
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13338
THIN WALLED SHELLS
A new and efficient formulation for finite element analysis of thin shell structures undergoing small and large deflection N87-12913
Non-linear analysis of cylindrical shells
[EPM/RT-86-37] N87-12917
Analysis of anisotropic thin conical shells
[EPM/RT-86-38] N87-12918
THREE AXIS STABILIZATION
A procedure for attitude determination of artificial satellites utilizing techniques of static and dynamic optimal estimation
[INPE-3966-PRE/981] N87-12589
THREE DIMENSIONAL BODIES
A software implementation of an interactive graphics system for three dimensional modeling and layout
[AD-A169264] N87-13183
THREE DIMENSIONAL FLOW
On 3-D inelastic analysis methods for hot section components (base program)
[NASA-CR-175060] N87-12923
THRUST
Propellar/body interaction for thrust and drag
[ESDU-86017] N87-12537
Electronic Engineering Department Thrust Area report, FY 1985
[DE86-013172] N87-12797
THRUST CONTROL
Thrust reverser-exhaust nozzle assembly for a gas turbine engine
[AD-D012390] N87-12561
THRUST REVERSAL
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
Thrust reverser-exhaust nozzle assembly for a gas turbine engine
[AD-D012390] N87-12561
THRUST VECTOR CONTROL
Brief analysis of normal attitude accuracies of satellites with wheels or gas jets
[INPE-3993-NTE/262] N87-12594
THUNDERSTORMS
Regular noise background in VLF-radiation and world thunderstorm centers N87-12957
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Severe storm electricity N87-13056
Optical characteristics of lightning and thunderstorm currents N87-13061
Optical characteristics of lightning N87-13062
Airborne atmospheric electricity experiments N87-13063
Mobile intercept of storms N87 13064
Remote observations of severe storms N87-13065
Analysis of satellite data for sensor improvement (detection of severe storms from space N87-13071
Severe storm detection with passive 37 GHz observations N87-13072
Remote sensing of severe convective storms N87-13075
A summary of research on mesoscale energetics of severe storm environments N87-13082
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13084
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111
NOSL experiment support
[NASA-CR-178947] N87-13140
TIME DEPENDENCE
Measurement of time-dependent electric current with Rogowski coil
[INPE-3875-RPE/506] N87-12754
Time-dependent solution for axisymmetric flow over a blunt body with ideal gas, CF4, or equilibrium air chemistry
[NASA-TM-87675] N87-12808
Free-Lagrangian hydrodynamics using massless tracer points
[DE86-012406] N87-12822
Data requirements to model creep in 9Cr-1Mo-V steel
[DE86-011754] N87-12944
A sensitivity study of a one-dimensional time-dependent warm cumulus cloud model
[AD-A170141] N87-13109
TIME DIVISION MULTIPLEXING
Progress with multiplexed sensor arrays based on reflection at spliced joints between sensors N87-13278
TIME OF FLIGHT SPECTROMETERS
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
TIME SERIES ANALYSIS
Vector analysis and satellite footprints
[AD-A169832] N87-12576
The Gulf Stream dynamics experiment. Inverted echo sounder data report for the June 1984 to May 1985 deployment period
[AD-A170758] N87-13121
Statistical models and methods for cluster analysis and image segmentation
[AD-A169145] N87-13229
TIMOSHENKO BEAMS
Dynamic analysis of a Timoshenko beam using a finite element approach
[EPM/RT-86-34] N87-12919
TIN
Use of Wannier function in the calculations of band structure of covalent crystals
[DE86-702668] N87-13344
TIPS
An experimental investigation of free-tip response to a jet
[NASA-TM-88250] N87-12539
Supplementary calibration test of the tip-aerodynamics- and acoustics-test pressure transducers
[NASA-TM-88312] N87-12830

TIROS SATELLITES
Application of satellite data to tropic/subtropic moisture coupling N87-13053
TISSUES (BIOLOGY)
Trace element-induced stress in freshwater wetland vegetation: Preliminary results N87-12985
TITANIUM ALLOYS
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
TITANIUM OXIDES
An interdisciplinary approach to predictive modeling of structural adhesive bonding. Characterization of Ti-6Al-4V oxides and the adhesive/oxide interphase
[AD-A170484] N87-12690
TOKAMAK DEVICES
Compact reactor studies
[DE85-013247] N87-13263
TOLERANCES (MECHANICS)
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169960] N87-12656
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
TOLERANCES (PHYSIOLOGY)
Self-paced heat acclimation procedures
[AD-A170533] N87-13134
Guidelines for safe human experimental exposure to impact acceleration
[AD-A169347] N87-13169
TOOLS
Light socket removal tool
[AD-D012368] N87-12710
TOPOGRAPHY
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
TOPOLOGY
HOMPACK: A suite of codes for globally convergent homotopy algorithms
[DE86-011644] N87-13196
TORNADOES
Detection of rotating thunderstorms using satellite imagery N87-13085
TORSION
Induced quantum torsion
[DE86-702616] N87-13348
TOUGHNESS
Micromechanisms of crack growth and fracture toughness in metal matrix composites
[AD-A169839] N87-12620
TOXICITY
Evaluating ecosystem response to toxicant stress: a state space approach
[DE86-011777] N87-13009
TRACKING (POSITION)
Solar array flight dynamic experiment
[NASA-TP-2598] N87-12561
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
Investigations of severe/tornadic thunderstorm development and evolution based on satellite and AVE/SESAME/VAS data N87-13064
TRAJECTORIES
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12640
Study in molecular lasers
[AD-A169933] N87-12955
TRANSFER FUNCTIONS
Theoretical study on the correlation between wideband electromagnetic spectra and geological structures
[AD-A169971] N87-13026
TRANSFER OF TRAINING
Simulator design features for helicopter landing on small ships. 1: A performance study
[AD-A169514] N87-12572
Simulator design and instructional features for carrier landing: A field transfer study
[AD-A169962] N87-12573
TRANSFERRED ELECTRON DEVICES
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170772] N87-12781
Investigation of a new concept in semiconductor microwave oscillators
[AD-A170831] N87-12782
TRANSFORMATIONS (MATHEMATICS)
Heredity of stationary and reversible stochastic processes
[AD-A169926] N87-13234
TRANSFORMERS
Transformers for explosive pulsed power coupling to various loads
[DE86-012425] N87-12796
TRANSISTORS
The analysis of a transistor cap as a heat dissipator
[AD-A171398] N87-12786
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8139)-2] N87-13314
TRANSITION FLOW
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3809] N87-12808
TRANSITION METALS
Transition metal. 2: Complexes of dithiacyclopheanes
[AD-A169107] N87-12651
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A168963] N87-13316
TRANSITION POINTS
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
TRANSMISSION
Transmission through ferrite samples at submillimeter frequencies
[AD-A169178] N87-12731
TRANSMISSION EFFICIENCY
Effects of optical feedback on the performance of high data rate single-mode fiber systems N87-13288
Wide bandwidth, long distance fibre-optic communication systems N87-13300
Performance of RF fiber optic links N87-13301
TRANSMITTANCE
Solid-state electrochromic switchable window glazings
[DE86-004455] N87-12700
TRANSMITTER RECEIVERS
Twin aperture phased array lens antenna
[AD-D012415] N87-12745
Tactical fiber optic assembly requirements N87-13305
TRANSONIC FLOW
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
TRANSPARENCE
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169269] N87-12931
TRANSPORT PROPERTIES
Stress effects on moisture transport in an epoxy resin and its composite
[AD-A169306] N87-12617
Transport and relaxation processes in supercritical fluids
[DE86-007847] N87-12638
Models and radiation of railgun plasma armatures with non-ideal plasma properties
[AD-A169349] N87-13258
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
TRANSVERSE OSCILLATION
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12815
TRIBOLOGY
Fundamental research on tribology
[AD-A169974] N87-12862
TRIGGER CIRCUITS
Coordinated research program in pulsed power physics
[AD-A169113] N87-12762
TROPICAL METEOROLOGY
USSR report: Earth sciences
[JPRS-UES-86-007] N87-12946
Third International Symposium on Tropical Meteorology N87-12948
Dynamics and energetics of the South Pacific Convergence Zone during FGGE SOP-1 N87-13052
Application of satellite data to tropic/subtropic moisture coupling N87-13053
TROPICAL REGIONS
Comparison of tropical forest surveys
[DE86-011699] N87-12993
TROPOSPHERE
Experimental research on turbulence in upper-level tropospheric clouds N87-12952
Parameterized numerical fit to total column ozone changes calculated by the LLNL 1-D model of the troposphere and stratosphere
[DE86-011008] N87-1304
Variation objective analyses for cyclone studies N87-1308
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-1311
TROPOSPHERIC SCATTERING
Foreground effects on troposcatter digital communication systems
[AD-A169380] N87-1273
TRUSSES
A mathematical formulation of a large space structure control problem
[AD-A169950] N87-1280
TUNGSTEN ALLOYS
Growth of ferro-electric tungsten bronze epitaxial thin films for electro-optic device applications
[AD-A170783] N87-1332
TUNING
Double-ended tuning fork quartz accelerometer
[DE86-012277] N87-12843
TUNNEL DIODES
Millimeter-wave heterojunction two-terminal devices
[AD-A169985] N87-12760
TURBINE BLADES
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
TURBINE ENGINES
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
Turbine air seal with full backside cooling
[AD-D012405] N87-12564
Improved vane platform sealing and retention means
[AD-D012407] N87-12861
TURBINES
Turbine air seal with full backside cooling
[AD-D012405] N87-12564
TURBOCOMPRESSORS
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
TURBOFAN ENGINES
Length adjustable strut link with low aerodynamic drag
[AD-D012279] N87-12543
Simplified forms of performance equations. Addendum A: Effect on aeroplane level speed of small changes in thrust, drag, weight, power
[ESDU-86004-ADD-A] N87-12556
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
TURBOJET ENGINES
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
TURBULENCE
Theory of developed hydrodynamical turbulence
[DE86-012796] N87-12823
Convective surface layers: Influence of the boundary layer depth N87-13041
TURBULENT BOUNDARY LAYER
A detailed analysis of the influence of eddy exchange processes upon the development of radiation fog
[AD-A169233] N87-13102
TURBULENT DIFFUSION
Middle atmosphere modeling
[NASA-CR-179934] N87-13023
TURBULENT FLOW
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
TURNING FLIGHT
Optimal descending, hypersonic turn to heading
[DE86-010989] N87-12577
TWINNING
Effect of residual strain on twinning in shock-loaded copper
[DE86-007362] N87-12660
TWO DIMENSIONAL FLOW
Forced oscillation of a two-dimensional airfoil with nonlinear aerodynamic loads
[AD-A169350] N87-12546
A numerical model for two-dimensional unsteady flow calculations with a surface panel method N87-12548

Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12912
TWO PHASE FLOW
Study of numerical solution methods for two-phase flows
[DE86-012265] N87-12821

U

ULTRASONIC SPECTROSCOPY
Quantitative non-destructive evaluation of composite materials based on ultrasonic wave propagation
[NASA-CR-179831] N87-12613
ULTRASONICS
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12908
Development of ultrasonic modelling techniques for the study of seismic wave scattering due to crustal inhomogeneities
[AD-A170017] N87-13034
ULTRAVIOLET LASERS
Direct writing of microstructures for solid-state electronics
[AD-A170837] N87-12783
ULTRAVIOLET SPECTRA
Optical spectroscopy of dynamically compressed liquids
[AD-A169013] N87-12629
UNDERWATER ACOUSTICS
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
UNITED STATES
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
UNIVERSE
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
UNIVERSITIES
Technology transfer at Pacific Northwest Laboratory
[DE86-012333] N87-13381
UNSTEADY FLOW
A numerical model for two-dimensional unsteady flow calculations with a surface panel method N87-12548
In-line and transverse forces on smooth and rough cylinders in oscillatory flow at high Reynolds numbers
[AD-A169562] N87-12615
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12616
UPPER ATMOSPHERE
The upper atmosphere of Venus: A tentative explanation of its rotation
[NASA-TM-88505] N87-13375
URANIUM
Status of laser enrichment technology updated N87-12717
USER MANUALS (COMPUTER PROGRAMS)
Assessment of damage tolerance requirements and analyses: A user's manual for crack growth and crack initiation analysis: DAMGRO
[AD-A171209] N87-12939
User's guide for NPSOL (version 4.0): A Fortran package for nonlinear programming
[AD-A169115] N87-13180
Evaluation of automated decisionmaking methodologies and development of an integrated robotic system simulation. Appendix B: ROBSIM programmer's guide
[NASA-CR-178052] N87-13203
USER REQUIREMENTS
General purpose aft cargo carrier study, volume 1
[NASA-CR-178905] N87-12587
SARSAT (Search and Rescue Satellite) operational data categorization and accuracy studies
[AD-A169748] N87-12599
A measure of usability — man machine systems N87-13163
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
UTAH
Abundance and distribution of mineral components associated with Moses Rock (kimberlite) diatreme N87-12975

V

VACUUM
Population inversions in laser-initiated vacuum arcs
[AD-A170611] N87-12859
VACUUM SYSTEMS
Tara vacuum system
[DE86-011873] N87-13311
VANADATES
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320
VANES
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
Super gripper variable vane arm
[AD-D012364] N87-12674
Improved vane platform sealing and retention means
[AD-D012407] N87-12881
VAPOR DEPOSITION
Fabrication of gate array interconnect structures using direct-write deposition processes
[DE86-010785] N87-12787
Experimental thin film deposition and surface analysis techniques
[DE86-011222] N87-13336
VAPOR PRESSURE
Vapour pressures and critical points of liquids. Part 2C: Alkadienes and alkynes
[ESDU-86001-PT-2C] N87-12624
Vapour pressures and critical points of liquids. Part 3A: C6 to C10 alkylbenzenes
[ESDU-86012-PT-3A] N87-12625
VAPORIZING
Apparatus for downward transport of heat
[DE86-013700] N87-12824
VARIABILITY
Super gripper variable vane arm
[AD-D012364] N87-12674
Effects of variables upon pyrotechnically induced shock response spectra
[NASA-TP-2603] N87-12921
VARIABLE STARS
Los Alamos Science, number 13, spring 1986
[DE86-012864] N87-13371
VARIATIONAL PRINCIPLES
A variational principle for the plasma centrifuge
[INPE-3989-PRE/992] N87-12827
VARIATIONS
The optimal linear combination of control variates in the presence of bias
[AD-A169111] N87-13210
Parametric linear variation of a leakage free permanent magnet field source
[AD-D012359] N87-13249
Rapid fluctuations in solar flares
[NASA-CR-179894] N87-13387
VASOCONSTRICTION
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127
VECTOR ANALYSIS
Vector analysis and satellite footprints
[AD-A169832] N87-12576
Quantum chemical investigations of the mechanism of cationic polymerization and theoretical prediction of crystal densities and decomposition pathways of energetic molecules
[AD-A169805] N87-13324
VECTOR SPACES
Some tactical algorithms for spherical geometry
[AD-A170615] N87-12555
VECTORS (MATHEMATICS)
Induced quantum torsion
[DE86-702616] N87-13348
VEGETATION
Detection of hydrothermal alteration at Virginia City, Nevada using Airborne Imaging Spectrometry (AIS) N87-12978
Preliminary geological investigation of AIS data at Mary Kathleen, Queensland, Australia N87-12979
VELOCITY MEASUREMENT
Doppler effect laser velocity measuring system
[AD-D012401] N87-12854
VENTILATION
Empirical determination among superintendents of the acceptable user surface in digitally automated heating-ventilation air conditioning systems N87-13165
VENUS ATMOSPHERE
The upper atmosphere of Venus: A tentative explanation of its rotation
[NASA-TM-88505] N87-13375

VENUS SURFACE
Relief and geology of the north polar region of the planet Venus
[NASA-TM-88498] N87-13376
VERTEBRAL COLUMN
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
VERTICAL AIR CURRENTS
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220057] N87-13014
Mesoscale-cloud scale simulation of convective response N87-13077
VERTICAL TAKEOFF AIRCRAFT
The handling qualities and flight characteristics of the Grumman design 698 simulated twin-engine tilt Nacelle V/STOL aircraft
[NASA-TM-86785] N87-12558
VERY LARGE SCALE INTEGRATION
Signal estimation, scattering theory and interpolation problems in one and two dimensions
[AD-A169969] N87-12759
Compaction with automatic jog introduction
[AD-A169679] N87-12772
Declarative descriptions for VLSI generators
[AD-A169952] N87-12777
Yield and performance enhancement through redundancy in VLSI and WSI multi-processor systems
[AD-A169930] N87-13174
Plasma-enhanced deposition and processing of transition metals and transition metal silicides for VLSI
[AD-A168963] N87-13316
VERY LONG BASE INTERFEROMETRY
Meter-level orbit determination of geosynchronous satellites by an economical tracking system N87-12575
Observation model and parameter partials for the JPL VLBI parameter estimation software MASTERFIT-1986
[NASA-CR-179919] N87-13178
VERY LOW FREQUENCIES
Regular noise background in VLF-radiation and world thunderstorm centers N87-12957
VHSIC (CIRCUITS)
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
VIBRATION EFFECTS
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611
VIBRATION TESTS
Investigation of vibrations of the spinal column of healthy subjects N87-13155
VIBRATIONAL SPECTRA
Carbon monoxide adsorption on a platinum electrode studied by polarization modulated FT-IR reflection-absorption spectroscopy. 2: CO adsorbed at a potential in the hydrogen region and its oxidation in acids
[AD-A169082] N87-12632
VIDEO DATA
Quality management: An annotated bibliography
[AD-A169816] N87-12912
VIDEO SIGNALS
Single-mode-fibers for fiberoptic-guided missiles: A comparison with graded-index multimode fibers N87-13303
VIEWING
Viewport concept for space station modules
[NASA-TM-86559] N87-12592
VISCOELASTICITY
Characterization and dynamical studies of polymers in dipolar (aprotic) liquids
[AD-A169243] N87-12885
Stress assisted diffusion in elastic and viscoelastic materials
[AD-A169298] N87-12932
Fracture and viscoelastic characteristics of the human cervical spine
[AD-A170002] N87-13133
VISCOPLASTICITY
Finite element analyses of shear localization in rate and temperature dependent solids
[AD-A169057] N87-12927
VISCOUS FLOW
Viscous-inviscid interaction in transonic separated flow over solid and porous airfoils and cascades N87-12535
VISION
The eye-mark investigation as an anthropotechnical method to study man machine systems N87-13160

VISUAL DISCRIMINATION
The event related brain potential as an index of information processing and cognitive activity. A program of basic research. Supplement A: Neuromagnetic studies
[AD-A169978] N87-13144
VISUAL PERCEPTION
Limits of pattern discrimination in human vision
[AD-A170756] N87-13135
VISUAL STIMULI
High-resolution analysis of eye movements
[AD-A170779] N87-13136
VOICE COMMUNICATION
Space flight operations communications phraseology and techniques
[NASA-TM-86562] N87-12721
A test on the reliability and performance of the verbex series 4000 voice recognizer
[AD-A169066] N87-12729
VOIDS
A study of the mechanism of dynamic ductile fracture of two-phase materials
[AD-A168966] N87-12925
Stefan-type problem with void formation and its explicit solution
[DE86-013521] N87-13007
VOLT-AMPERE CHARACTERISTICS
The current-voltage relationship in auroral current sheets
[AD-A169074] N87-13028
VOLTAGE AMPLIFIERS
High frequency, high voltage MOSFET isolation amplifier
[AD-D012403] N87-12774
VOLTAGE CONTROLLED OSCILLATORS
Stabilization of voltage-controlled oscillators through resonant cavities
[INPE-3941-RPE/512] N87-12757
VOLTAGE GENERATORS
Cryogenic wound rotor for lightweight, high voltage generators
[AD-D012370] N87-12768
VORTEX RINGS
Transition and mixing in axisymmetric jets and vortex rings
[NASA-CR-3893] N87-12808
VORTEX SHEDDING
Computational fluid dynamic studies of certain ducted bluff-body flowfields relevant to turbojet combustors. Volume 1: Time-dependent calculations with the k-epsilon turbulence model for an existing centerbody combustor
[AD-A171434] N87-12816
VORTICES
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
An analysis of blade vortex interaction aerodynamics and acoustics N87-12547
Visualisation of axial turbine tip clearance flow using a linear cascade
[CUED/A-TURBO/TR-122] N87-12560
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
VOWELS
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746
VULNERABILITY
Maximization of the capacity of the most survivable connections in a network
[AD-A169065] N87-12728

W

WAKEFULNESS
Pharmacological resetting of the circadian sleep-wake cycle
[AD-A170804] N87-13137
WALL FLOW
The calculation of separated flows of low-viscosity liquids using the Batchelor Model
[BR-100272] N87-12810
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12817
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831
WALL TEMPERATURE
Analysis of laminar flow heat transfer in uniform temperature circular tubes with tape inserts
[PB86-224763] N87-12826
WALLS
Natural convection in an enclosure with discrete roughness elements on a vertical heated wall
[DE86-004424] N87-12817
Fluids in contact with a hard surface: University of the bridge functions for the density profile
[AD-A168945] N87-13308
WARNING SYSTEMS
FEL (Free Electron Laser) optics coating test program (design phase of sample introduction chamber)
[AD-A169474] N87-12849
Obstacle-warning radar for helicopters N87-13149
WASTE DISPOSAL
Meteorological tower data, Yucca Ridge (YR) site, January-June 1983. Nevada Nuclear Waste Storage Investigations Project
[DE86-012732] N87-13113
Concept study - vehicle waste disposal system
[AD-A169045] N87-13168
WATER
Development testing of large volume water sprays for warm fog dispersal
[NASA-TP-2607] N87-12585
WATER RESOURCES
Characterization of information requirements for studies of CO2 effects: Water resources, agriculture, fisheries, forests and human health
[DE86-012477] N87-13010
WATER VAPOR
Diamond-machined aluminum alloy 5083 surfaces: Controlled exposure evaluation
[DE86-012572] N87-12674
Atmospheric-water absorption features near 2.2 micrometers and their importance in high spectral resolution remote sensing N87-12973
Multispectral atmospheric mapping sensor of mesoscale water vapor features N87-13095
Radiation flux tables for ICRCCM using the GLA GCM radiation codes
[NASA-TM-89270] N87-13098
WATERSHEDS
Evaluation of remote sensing techniques to the detection of changes in a fluvial system due to human influence: The example of Canas River Basin (Sao Paulo State, Brazil)
[INPE-3970-PRE/983] N87-12960
WAVE ATTENUATION
Spatial radio wave attenuation during vertical sounding of ionosphere N87-12958
WAVE DISPERSION
Propagation of electromagnetic waves in superlattices
[DE86-702660] N87-12753
WAVE EQUATIONS
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120
Nonlinear waves
[AD-A168934] N87-13207
WAVE EXCITATION
Lg wave excitation and propagation in presence of one-, two- and three-dimensional heterogeneities
[AD-A169004] N87-12724
Lg wave excitation and propagation in presence of one-, two-, and three-dimensional heterogeneities
[AD-A169325] N87-13030
WAVE FRONTS
Phase conjugate optics and picosecond optoelectronics
[AD-A169180] N87-13265
WAVE FUNCTIONS
Theory of Fractional Quantum Hall Effect
[DE86-702652] N87-13343
WAVE GENERATION
High repetition rate electron beam RF-Acceleration and sub-millimeter wave generation via a free electron laser
[AD-A169846] N87-12853
WAVE INTERACTION
Nonlinear interactions in the microwave sensing of oceanic internal waves
[AD-A169776] N87-13120
Nonlinear planar guided wave interactions and devices N87-13290
WAVE PROPAGATION
Quantitative non-destructive evaluation of composite materials based on ultrasonic wave propagation
[NASA-CR-179831] N87-12613
Lg wave excitation and propagation in presence of one-, two- and three-dimensional heterogeneities
[AD-A169004] N87-12724
Method of ray intensity calculation as applied to anomalous propagation
[AD-A169553] N87-12737
Stabilizing effects of finite-amplitude RF waves on the interchange instability
[DE86-013042] N87-12751
Propagation of electromagnetic waves in superlattices
[DE86-702660] N87-12753
Influence of shear modulus on the behavior of acoustically transparent materials
[AD-A169269] N87-12931
Phase fluctuations of ionosphere radio signals N87-12955
Nonlinear waves
[AD-A168934] N87-13207
Bistability in nonlinear waveguides N87-13291
WAVE REFLECTION
Effect of pulsating auroras on frequency-time characteristics of radio signals reflected from auroral ionosphere N87-12954
Phase fluctuations of ionosphere radio signals N87-12955
WAVE SCATTERING
Theory for computing the field scattered from a smooth inflected surface
[NASA-TP-2632] N87-13254
WAVEFORMS
Reconstruction of undersampled periodic signals
[AD-A168897] N87-12722
WAVEGUIDE LASERS
Basic and applied research in the field of electronics and communications
[AD-A169029] N87-12727
WAVEGUIDES
Dielectric antennas for millimeter-wave applications
[AD-A169885] N87-12739
Input impedance of an infinite linear scanned array of flat rectangular strips inside a dielectric loaded parallel plate waveguide
[AD-A171275] N87-12784
A 60 GHz gyrotron development program
[DE86-012488] N87-12791
WAVELENGTH DIVISION MULTIPLEXING
Wavelength division multiplexing at 1.5 microns for high capacity optical transmission N87-13284
A spherical waveguide multiplexer-demultiplexer N87-13285
WAVELENGTHS
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13309
WEAPON SYSTEMS
The Department of Defense Very High Speed Integrated Circuit (VHSIC) Technology Availability Program plan for the Committees on Armed Services, United States Congress
[AD-A169250] N87-12763
WEAR
Fundamental research on tribology
[AD-A169974] N87-12862
WEATHER
Aircraft accident/incident summary reports: Erie, Pennsylvania, October 14, 1984; Albuquerque, New Mexico, February 11, 1985
[PB86-910407] N87-12549
Aircraft accident report: Bar Harbor Airlines Flight 1808, Beech BE-99, N300WP, Auburn-Lewiston Municipal Airport, Auburn, Maine, August 25, 1985
[PB86-910408] N87-12550
Observational and theoretical studies of the evolving structure of baroclinic waves: Attractor dynamics of global weather systems N87-13054
The meteorological interactive data display system N87-13091
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107
WEATHER DATA RECORDERS
The siting, installation and operational suitability of the Automated Weather Observing System (AWOS) at heliports
[DOT/FAA/PM-86/30] N87-13099
WEATHER FORECASTING
The use of satellite data in understanding and predicting convective and large-scale dynamical processes N87-13049
Utilization of satellite cloud information to diagnose the energy state and transformations in extratropical cyclones N87-13051
LAMPS software and mesoscale prediction studies N87-13076
The assimilation of satellite soundings, winds and satellite products in a mesoscale analysis/forecast system N87-13080
A design study for a three-dimensional display computer terminal for meteorological information N87-13092
Summary of 1986 Atlantic tropical cyclone activity and verification of author's seasonal forecast N87-13097

Some proposals for modifying the Probability of Precipitation Program of the National Weather Service
[PB86-226636] N87-13115

WEATHER STATIONS
Station climatic summaries, Europe
[AD-A167868] N87-13100
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106

WEIGHT REDUCTION
Fabrication and testing of lightweight hydraulic system simulator hardware
[AD-A169884] N87-12711

WELD STRENGTH
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914

WELDED JOINTS
Use of analytical electron microscopy in evaluating ferrite stability in austenitic stainless steel welds
[DE86-008537] N87-12667
Microstructural study of high energy density dissimilar metal welds
[DE86-009284] N87-12668
Cleaning of aluminum alloy 5083
[DE86-012573] N87-12675
Effect of convection on weld pool shape and microstructure
[AD-A170488] N87-12883
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of chromium-nickel steel. Supplement 1: Records of procedure qualification tests
[DE86-012521] N87-12886
Machine gas metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012530] N87-12887
Welding procedure specification. Semiautomatic gas metal arc welding of carbon steels. Supplement 1: Records of procedure qualification tests
[DE86-012531] N87-12888
Welding procedure specification. Manual gas tungsten arc and semiautomatic gas metal arc welding of carbon steel. Supplement 1: Records of procedure qualification tests
[DE86-012532] N87-12889
Gas tungsten arc and shielded metal arc welding of carbon steel. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012533] N87-12890
Welding procedure specification. Supplement 1: Records of procedure qualification tests. Shielded metal arc welding of carbon steel
[DE86-012535] N87-12891
Welding procedure specification. Gas tungsten arc welding of chromium-nickel steel to chromium-molybdenum steel. Supplement 1: Records of procedure qualification tests
[DE86-012536] N87-12892
Gas tungsten arc welding of aluminum alloys 6XXX. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012548] N87-12893
Gas tungsten arc welding of carbon steel to nickel-chromium-iron. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012549] N87-12894
Welding procedure specification: Gas tungsten arc welding of nickel to nickel-chromium-iron. Supplement 1: Records of procedure qualification tests
[DE86-012557] N87-12896
Gas tungsten arc welding of aluminum alloys 3004, 5052 and 5x54 to 6xxx. Welding procedure specification. Supplement 1: Records of procedure qualification tests
[DE86-012561] N87-12897
Effects of inertia weld parameters and contamination on weld flash shape and on joint strength: An improved study
[DE86-013074] N87-12904
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12908
Guide to the use of data items on the fatigue strength of welded joints in steels
[ESDU-86013] N87-12914

WELDING
Mechanics of metal forming
[DE86-012414] N87-12673
Welding research in Scandinavia: An assessment
[AD-A169036] N87-12871
Welding science and technology in Europe: A survey and assessment
[AD-A169279] N87-12873
Heat measurements in inertia welding of aluminum to steel
[DE86-012463] N87-12885
Effects of inertia weld parameters and contamination on weld flash shape and on joint strength: An improved study
[DE86-013074] N87-12904
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905
Resistance seam welding
[DE86-013288] N87-12906
Concurrent ultrasonic weld evaluation system
[DE86-013772] N87-12908

WEST GERMANY
Review of the methods applied in the Federal Republic of Germany to investigate human factors in nuclear power plant control N87-13156

WETLANDS
Trace element-induced stress in freshwater wetland vegetation: Preliminary results N87-12985

WHISKERS (CRYSTALS)
Carbon fibers
[AD-A171370] N87-12622

WIDE ANGLE LENSES
Space infrared telescope facility wide field and diffraction limited array camera (IRAC)
[NASA-CR-177041] N87-13362

WIND (METEOROLOGY)
NASA/MSFC FY-85 Atmospheric Processes Research Review
[NASA-CP-2402] N87-13043
Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
The use of satellite data in understanding and predicting convective and large-scale dynamical processes N87-13049
Variation objective analyses for cyclone studies N87-13050
Airborne Doppler measurements of the central California extended sea breeze N87-13066
Airborne Doppler lidar activities N87-13068
Response of the mesoscale atmosphere to diabatic heating N87-13069
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
The assimilation of satellite soundings, winds and satellite products in a mesoscale analysis/forecast system N87-13080
Micrometeorological transitions in the morning boundary layer over rolling terrain
[AD-A169237] N87-13103
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110

WIND DIRECTION
Characteristics of atmospheric turbulence near the ground. Part 3: Variations in space and time for strong winds (neutral atmosphere)
[ESDU-86010-PT-3] N87-13042

WIND MEASUREMENT
Multiscale modeling to evaluate proposed space-based Doppler lidar sampling strategies N87-13047
Airborne Doppler measurements of the central California extended sea breeze N87-13066
Doppler wind profile experiment N87-13094
Calibration and accuracy of the NOAA/ERL gust probe system and intercomparison with other systems
[PB86-221736] N87-13116

WIND PROFILES
Atmospheric Tides Middle Atmosphere Program (ATMAP): Report of the workshop, Kyoto, Japan, December 5-6, 1984 N87-13016
Airborne Doppler lidar activities N87-13068
Automated mesoscale winds derived from GOES multispectral imagery N87-13073
Doppler wind profile experiment N87-13094

WIND TUNNEL TESTS
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
Mach 6 experimental and theoretical stability and performance of a finned cylindrical body at angles of attack up to 65 deg
[NASA-TM-89050] N87-12538
Effect of port corner geometry on the internal performance of a rotating-vane-type thrust reverser
[NASA-TP-2624] N87-12541
Cruise noise of counterrotation propeller at angle of attack in wind tunnel
[NASA-TM-88869] N87-13252

WIND VELOCITY
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033

WINDING
Cryogenic wound rotor for lightweight, high voltage generators
[AD-D012370] N87-12768

WINDOWS (APERTURES)
Solid-state electrochromic switchable window glazings
[DE86-004455] N87-12700

WING LOADING
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570

WING TIP VORTICES
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AD-A169116] N87-12544

WINGLETS
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533

WINTER
Minutes of MAP/WINE experimenters meeting, Prague, Czechoslovakia, August 13, 1985 N87-13018

WIRE
Development of a numerical procedure to treat wires attached to arbitrarily shaped conducting bodies
[AD-A169384] N87-12764
Development of buried wire gages for measurement of wall shear stress in Blastane experiments
[NASA-TM-89212] N87-12831

WOOD
Preliminary material testing of ceramic and wood
[AD-A169557] N87-12771

WORDS (LANGUAGE)
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746

WORK-REST CYCLE
Self-paced heat acclimation procedures
[AD-A170533] N87-13134

WORKING FLUIDS
Apparatus for downward transport of heat
[DE86-013700] N87-12824

WORKLOADS (PSYCHOPHYSIOLOGY)
Application of heart rate measurements to maritime research simulator
[AD-A169988] N87-13132
Perceptual factors in workload: A neuromagnetic study
[AD-A169934] N87-13142
Eye movements as an index of mental workload
[AD-A169941] N87-13143
Determination of the load and stress of a cockpit crew during aircraft piloting using task networks and the simulation language SAINT N87-13150
System-ergonomic workload analysis for highly automated process control tasks N87-13152
The measurement of the psychological workload during task-related activities, including car driving, by competing time interval estimation N87-13153
Review of the methods applied in the Federal Republic of Germany to investigate human factors in nuclear power plant control N87-13156
Inquiry techniques for the evaluation of man machine systems N87-13162

WROUGHT ALLOYS
Fatigue behavior of long and short cracks in wrought and powder aluminum alloys
[AD-A169980] N87-12656

X

X RAY ANALYSIS
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612

X RAY APPARATUS
Potential applications of artificially structured materials for X-ray microanalysis
[DE86-010459] N87-12612

X RAY BINARIES
High energy neutrino absorption and its effects on stars in close X-ray binaries
[NASA-TM-89269] N87-13366
On the two states of CYG X-1 and related sources
[NASA-TM-89265] N87-13367

X RAY DIFFRACTION
Identification of hydrothermal alteration assemblages using airborne imaging spectrometer data N87-12977

X RAY FLUORESCENCE
X-ray fluorescence with synchrotron radiation
[DE86-010543] N87-13124

X RAY INSPECTION
NDE reliability and process control for structural ceramics
[NASA-TM-88870] N87-12910
X RAY LASERS
Sitless, intensified readout, gated spectrometer: Wavelength and efficiency calibration, time response characterization
[DE86-012349] N87-12839
Resonant photon pumping mechanisms for a plasma X-ray laser
[AD-D012418] N87-12857
Laser produced X-ray for high resolution lithography and a photoionization laser
[AD-A170782] N87-12858
X RAY SOURCES
Time Projection Compton Spectrometer (TPCS)
[DE86-012950] N87-12840
X-ray data booklet, revision
[DE86-012650] N87-13272
X RAY SPECTRA
Electron microprobe analysis: The upper limit of submicron spectroscopy
[DE86-009540] N87-12840
Time Projection Compton Spectrometer (TPCS)
[DE86-012950] N87-12840
Stratospheric balloon experiments
[INPE-3995-RPE/519] N87-13020
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program
[NASA-CR-179922] N87-13365
X-ray emission from supernova remnants N87-13398
X RAY SPECTROSCOPY
MAX '91: An advanced payload for the exploration of high energy processes on the active sun
[NASA-TM-89271] N87-13379
X RAYS
A survey of hard-X-rays at balloon altitudes of the Earth's atmosphere
[INPE-3954-PRE/972] N87-13398

Y

YAW
Frictional and retarding forces on aircraft tyres. Part 4: Estimation of effects of yaw
[ESDU-86016-PT-4] N87-12988
YIELD
Crop yield modeling for climate impact studies. Part 1: Reasoning and results
[INPE-3987-PRE/982-PT-1] N87-12961
YTTRIUM COMPOUNDS
Study to determine the feasibility of utilizing skull-melting techniques for the growth of single crystals of yttrium vanadate
[AD-A169249] N87-13320

Z

ZEEMAN EFFECT
Structural features at the Si-SiO2 interface
[DE86-012947] N87-13339
ZINC
Energetics of dislocation relaxation associated with cleavage in Cd-doped zinc crystals as probed by sychrotron topography
[DE86-002968] N87-13334
ZINC OXIDES
Zinc/nickel oxide battery membrane separator studies
[DE86-012624] N87-12793

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

PERSONAL AUTHOR

BELAND, R. W. N87-10436

NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

A

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
Guided Optical Structures in the Military Environment
[AGARD-CP-383] N87-13273
AEG-TELEFUNKEN, ULM (WEST GERMANY).
Obstacle-warning radar for helicopters N87-13149
AEROSPACE CORP., EL SEGUNDO, CALIF.
Vector analysis and satellite footprints
[AD-A169832] N87-12576
Picosecond optoelectronic diagnostics of field effect transistors
[AD-A170503] N87-12779
Comparison of 2D memory SEU transport simulation with experiments
[ATR-86(8130)-2] N87-13314
Contributions to the 18th International Cosmic Ray Conference
[ATR-86(9558)-11] N87-13389
The secondary production of gamma rays in the Jovian magnetosphere N87-13391
The stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances N87-13392
A versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation N87-13393
AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
The effects of high sustained acceleration on the acoustic phonetic structure of speech: A preliminary investigation
[AD-A170563] N87-12746
AIN SHAMS UNIV., CAIRO (EGYPT).
Possibility of using dc conductivity for investigating phase transition in amorphous semiconductors
[DE86-702646] N87-13340
AIR FORCE ACADEMY, COLO.
Optical rotation sensors
[AD-A169357] N87-12648
AIR FORCE ENVIRONMENTAL TECHNICAL APPLICATIONS CENTER, SCOTT AFB, ILL.
Station climatic summaries, Europe
[AD-A167888] N87-13100
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F Ellington ANGB, Texas
[AD-A169389] N87-13105
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F, Fort Richardson, Alaska
[AD-A169390] N87-13106
Wheeler AFB, Hawaii Limited Surface Observations Climatic Summary (LISOCS), parts 1-5
[AD-A169391] N87-13107
AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
A semi-empirical low-latitude ionospheric model
[AD-A168899] N87-13025
Collection of ions in the stratosphere
[AD-A169905] N87-13032
Balloon-borne, high altitude gravimetry: The flight of DUCKY 1a (11 October 1983)
[AD-A169942] N87-13033
Improving foF2 prediction for the sunrise transition period
[AD-A170457] N87-13036
Sensitivity tests of a surface-layer windflow model to effects of stability and vegetation
[AD-A169136] N87-13101
Medium- and long-wavelength infrared emission from a laser-produced oxygen plasma
[AD-A169475] N87-13309
AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
The portfolio model of technological development in the aircraft industry
[AD-A170832] N87-12534
Integrating computer vision with a robot arm system
[AD-A171278] N87-12684
A simple solar, spectral model for studying the effects of cloud cover and surface albedo on the incoming solar radiation
[AD-A171284] N87-13038
A review of microbursts and their analysis and detection with Doppler radar
[AD-A170458] N87-13110
Extraterrestrial forcing, atmospheric electricity and the occurrence of thunderstorms
[AD-A170463] N87-13111
AIR FORCE SYSTEMS COMMAND, WRIGHT-PATTERSON AFB, OHIO.
The effect of a winglet on the spatial vortex of a slender body at high angle of attack
[AD-A169925] N87-12533
The effect of coupling in an inertial navigation platform stabilized system made up of three single-degree-of-freedom gyroscopes
[AD-A169110] N87-12553
The Chinese guided missiles stride toward modernization
[AD-A169017] N87-12582
Carbon fibers
[AD-A171370] N87-12622
Metrics of closed world of Friedmann, agitated by electric charge (towards a theory electromagnetic Friedmann's)
[AD-A168981] N87-12723
Journal of engineering thermophysics (selected articles)
[AD-A169452] N87-13347
AIR FORCE WEAPONS LAB., KIRTLAND AFB, N. MEX.
Preliminary material testing of ceramic and wood
[AD-A169557] N87-12771
Holographic storage in ion-implanted, ferroelectric-phase PLZT ceramics
[DE86-010475] N87-12837
ALABAMA UNIV., HUNTSVILLE.
Cellular solidification of transparent monotectics
[NASA-CR-177039] N87-12626
Preliminary planning for the Satellite Precipitation And Cloud Experiment (SPACE) Field Program N87-13089
Space plasma research
[NASA-CR-178965] N87-13307
ALASKA UNIV., FAIRBANKS.
A study of the relationship between solar activity and interplanetary field variations
[AD-A169983] N87-13380
ALLIED BENDIX AEROSPACE, UTICA, N.Y.
Component improvement program task 83-01, 36E133 air turbine starter
[AD-A169483] N87-12562
ALLIED BENDIX CORP., KANSAS CITY, MO.
Image enhancement equipment capabilities
[DE86-013615] N87-12800
Resistance seam welding
[DE86-013266] N87-12906
Review of robotic component insertion system for printed wiring assemblies
[DE86-013510] N87-12907
AMES LAB., IOWA.
Crack propagation in high strain regions of a steel containment
[DE86-011437] N87-12943
In-situ interdiffusion measurements in HgTe-CdTe superlattices
[DE86-011429] N87-13337
Very high energy gamma ray astrophysics
[DE86-013319] N87-13396
ANALYTICAL METHODS, INC., REDMOND, WASH.
A summary of the development of integral aerodynamic methods for the computation of rotor wake interactions
[AD-A169254] N87-12545
ANCO ENGINEERS, INC., CULVER CITY, CALIF.
Radiographic determination of mass and inertial tensor of anatomical segments
[AD-A169122] N87-13126
ANT NACHRICHTENTECHNIK, BACKNANG (WEST GERMANY).
PIN-FET preamplifier for high-speed optical transmission systems N87-13293
APPLIED PHYSICS, INC., ALBUQUERQUE, N. MEX.
Radar cross-section of damped cylinders and dielectric strips
[AD-A169027] N87-12725
ARGONNE NATIONAL LAB., ILL.
Computational and experimental study of flow-induced vibration of the SSME main injector post
[DE86-012119] N87-12611
Stability of multilayers at high temperatures
[DE86-010526] N87-12623
Band description of materials with localizing orbitals
[DE86-010529] N87-13255
ARIZONA STATE UNIV., TEMPE.
Degeneracy in the ensemble Monte Carlo method for high field transport in semiconductors
[AD-A169456] N87-13321
ARIZONA UNIV., TUCSON.
Inequalities for probability contents of convex sets via geometric average
[AD-A169936] N87-13219
A Bayesian approach to quantile and response probability estimation with applications in reliability
[AD-A170455] N87-13240
Nonlinear planar guided wave interactions and devices N87-13290
Integrated optics optical limiters N87-13292
Investigations of long-period DQ Herculis star N87-13364
ARMY BELVOIR RESEARCH AND DEVELOPMENT CENTER, FORT BELVOIR, VA.
Reliability prediction models for mechanical equipment
[AD-A169775] N87-12911
ARMY CLOSE COMBAT ARMAMENTS CENTER, WATERVLIET, N.Y.
Embrittlement of a high and a low strength steel in liquid lead environment
[AD-A169443] N87-12653
Linear elastic fracture testing: Current status within ASTM committee E-24 on fracture
[AD-A169442] N87-12934
Computation of residual stresses due to phase transformations during quenching of hollow cylinders
[AD-A170493] N87-12937
Unloading-compliance and load-drop analysis of J(Ic) test of irradiated 348 stainless steel
[AD-A170494] N87-12938
ARMY COLD REGIONS RESEARCH AND ENGINEERING LAB., HANOVER, N. H.
MIZEX: A program for mesoscale air-ice-ocean interaction experiments in arctic marginal ice zones. 8: A science plan for a winter marginal ice zone experiment in the Fram Strait/Greenland Sea, 1987/89
[AD-A169070] N87-13119
ARMY COMMUNICATIONS-ELECTRONICS COMMAND, FORT MONMOUTH, N.J.
Tactical fiber optic assembly requirements N87-13305

SOURCE

ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.
Pressure calculation for two-dimensional flow inside hydraulic structures
[AD-A169039] N87-12812
ARMY FIELD ARTILLERY SCHOOL, FORT SILL, OKLA.
Government libraries. A periodicals bibliography, together with list of bibliographies and indexes

ARMY MATERIALS AND MECHANICS RESEARCH CENTER, WATERTOWN, MASS.
Mechanical testing of a coated carbon-carbon composite at elevated temperatures in air
[AD-A169355] N87-12618
ARMY MILITARY PERSONNEL CENTER, ALEXANDRIA, VA.
Special associative preprocessing structures for qualitative feature extraction
[AD-A169147] N87-13181
ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
Evaluation of the Collins/Rockwell two axis gyro/accelerometer sensor cluster (phase 3 unit)
[AD-A169810] N87-12634
Evaluation of the multifunction sensor acceleration sensitive terms MU sub A and MU sub B
[AD-A169811] N87-12635
ARMY RESEARCH INST. OF ENVIRONMENTAL MEDICINE, NATICK, MASS.
Hypothermic effects on vascular contractility and reactivity
[AD-A169142] N87-13127
Quantification of respiratory muscle performance
[AD-A169208] N87-13128
Human thermoregulatory model for immersion in cold water
[AD-A169779] N87-13131
Self-paced heat acclimation procedures
[AD-A170533] N87-13134
ARMY RESEARCH OFFICE, RESEARCH TRIANGLE PARK, N. C.
Proceedings of the conference on the design of experiments in army research development and testing (31st) held at the Madison, Wisconsin on 23-25 October 1986
[AD-A169473] N87-13246
ARNOLD ENGINEERING DEVELOPMENT CENTER, ARNOLD AIR FORCE STATION, TENN.
Analysis and verification of the icing scaling equations. Volume 1: Revision
[AD-A167976] N87-12551
Effects of test cell recirculation on high-bypass turbofan engines during simulated altitude tests
[AD-A171418] N87-12565
ATMOSPHERIC AND ENVIRONMENTAL RESEARCH, INC., CAMBRIDGE, MASS.
Intercomparison of DMSP OLS, NOAA AVHRR, GOES VISSR (Defense Meteorological Satellite Program Operational Linescan System, National Oceanographic and Atmospheric Administration Advanced Very High Resolution Radiometer, GOES Visible Infrared Spin-Scan Radiometer) and Landsat MSS imagery for cloud pr operty determination: Recommendations for digital data analysis
[AD-A169265] N87-12991
Improving numerical weather prediction by maximizing the use of assimilated satellite data
[AD-A169295] N87-13104
AUBURN UNIV., ALA.
Sensor controlled robotic welding for nuclear applications
[DE86-013110] N87-12905

B

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Blast gust loading on a 35 degree swept-back wing
[AD-A169415] N87-12570
Stability of liquid-filled projectiles with unusual coning frequencies
[AD-A171460] N87-12584
BARR AND STROUD LTD., GLASGOW (SCOTLAND).
Performance of integrated optical frequency shifters pigtailed to high birefringence fibres using ion-milled grooves N87-13289
BATTELLE COLUMBUS LABS., OHIO.
Hot isostatic pressing of ceramic powder compacts
[AD-A169971] N87-12688
Laser produced X-ray for high resolution lithography and a photoionization laser
[AD-A170782] N87-12656
BATTELLE MEMORIAL INST., COLUMBUS, OHIO.
Micromechanisms and toughness for cleavage fracture of steel
[AD-A169906] N87-12655
BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
Study of the formation and transport of acidic species by non-precipitating cumulus clouds during VENTEX-84
[PB86-220357] N87-13014
BELL COMMUNICATIONS RESEARCH, INC., MORRISTOWN, N.J.
A hybrid transmission scheme on single mode fibers for tactical communications N87-13306

Typical Contract Number Index Listing

N00014-81-C-0008 ..... N87-10545

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.
